Title: Protecting the Pee-pee: A Comparison of Robotic Assisted Laparoscopic Prostatectomy and External Beam Radiation Therapy for Urinary and Sexual Function in Men Treated for Prostate Cancer.

Approved: _____

Dr. Carrie McCurdy

INTRODUCTION: Prostate cancer is the second most commonly diagnosed cancer in men. Robot Assisted Laparoscopic Prostatectomy (RALP) and External Beam Radiation Therapy (EBRT) are standard treatments for clinically localized prostate cancer, but both of these treatments have negative consequences for urinary and sexual function in patients.

PURPOSE: To compare changes in urinary and sexual function for men treated with RALP and EBRT.

HYPOTHESIS: It was hypothesized that patients treated with EBRT would have better recovery of sexual function, and patients treated with RALP would have better recovery of urinary function.

METHODS: Urinary and sexual function for patients treated for prostate cancer was examined using EPIC questionnaires. These questionnaires were completed before treatment and two years after initial treatment in 32 men treated with EBRT, and 104 men treated with RALP. The difference between initial treatment scores and 2-year

scores were analyzed with a GLM procedure to assess the quality of life outcomes for EBRT and RALP.

RESULTS: No significant difference was found for change in urinary function for either treatment group ($p = 0.41$). EBRT was found to significantly increase recovery sexual function compared to RALP ($p = 0.04$).

CONCLUSION: EBRT is a better treatment for preserving sexual function in men with prostate cancer, and urinary function will be largely similar with either treatment.

Acknowledgements

There are many wonderful people who helped me through this rewarding process, and I appreciate the opportunity to formally thank them now. I would like to thank Dr. Carrie McCurdy for agreeing to be my Primary Thesis Advisor. Thank you for your guidance that allowed me to find the most incredible resources that were invaluable to the development of this project. Thank you to Dr. David DiMarco for helping me navigate the nuances of clinical research for prostate cancer. I appreciate your expertise in this field. Thank you to Dr. Kelly Sutherland for being a wonderful CHC advisor, and for agreeing to be on my Thesis Committee. I have greatly valued your guidance in my time here at the University of Oregon. I am so grateful to Gerald Rouleau, a former OUI intern and a wonderful statistical analyst, who saved my sanity by agreeing to help me with the statistical analysis. The analysis you conducted was invaluable to the validity and importance of this project. Thank you Jon Runyeon, for kindly offering to let me do an abdominal prosection on a cadaver in the anatomy lab so I could understand the prostate anatomy on a more in-depth level. The experience helped me understand the significance of the abdominal anatomy in this project. Perhaps I am most appreciative to Stephanie Kerns and Renee Podesta, who must have decided that I was sassy enough to get along with and chose to give me the opportunity of being an intern at OUI. You have both been so helpful and encouraging as I have worked to pull this project together, and I am so grateful. Thank you to Martin Allums, who created the fabulous illustrations that made this project look much more professional than I could have ever imagined. I look forward to the day when every medical textbook I open is bursting with your illustrations. Finally, I would like to thank

my parents Liz and Doug Fischer. Your support and never-ending encouragement has always allowed me to do way more than I ever should, and kept me sane while I muddled through it. In the end I know that I am Julia Pauline Fischer, and I am loved very much. Thank you for being my parents, I love you.

Background: An Overview of Prostate Cancer

Anatomy and Physiology of the Prostate

The prostate is a male specific organ that encircles the urethra and borders the inferior aspect of the bladder. The prostate contains the ejaculatory duct, which is the end of the spermatic tube that extends all the way down from the testes. Sperm travel through this tube to get to the urethra during ejaculation. Nerves that supply the urethra and penis run posterior-laterally along the prostate and are contained in the neurovascular bundles. The function of the prostate is to create and secrete certain components found in semen. One of these components is prostate specific antigen (PSA), which is a protein that helps maintain a low viscosity in semen to allow the sperm to swim freely (LEE et al., 1989).

Prostate Cancer

Prostate cancer is the second most frequently diagnosed cancer in the United States, falling only behind skin cancer (Haas et al., 2008). In a healthy functioning prostate the PSA that is produced is almost entirely secreted into the urethra during ejaculation, with only small levels leaking into blood stream circulation (Stenman et al., 1999). When prostate cells become cancerous they rapidly proliferate and create an excess amount of PSA. This is more PSA than can be secreted into the urethra during ejaculation, and the excess is leaked into circulation and that be detected by a blood tests and indicate abnormal prostatic tissue growth (Smith et al., 2009). Thus, PSA screenings are conducted by physicians in men over 50 to look for sharp increases in PSA that could indicate prostate cancer (Smith et al., 2009).

While elevated PSA levels may indicate a cancer, there are other conditions that can cause PSA levels to rise. Benign Prostatic Hyperplasia (BPH) is a common condition among men over the age of 50, and also results in elevated levels of PSA (Stenman et al., 1999). BPH is a condition where the prostate grows larger without evidence of malignancy (Stenman et al., 1999). This additional growth of prostate cells will also produce an excess of PSA, which will be detected in a blood test. Other conditions such as a bladder or prostate infection can also cause the PSA to spike. If no inflammation or infection is clinically apparent, then further evaluation of elevated PSA often includes Transrectal Ultrasound (TRUS) guided biopsy of the prostate to deduce if prostate cells have become cancerous (Heidenreich et al., 2008).

A Transrectal Ultrasound (TRUS) guided biopsy takes up to 12 samples of prostatic tissue in each region of the prostate to test for malignancy. The samples taken

from the TRUS biopsy are examined and given a Gleason Score. This measures the histological appearance and number of cancerous prostate cells in the sample, and assigns them a grade from 1 to 5 (Humphrey, 2004). A grade of 1 represents cells that are packed closely together but are still separated with a uniform appearance and well differentiated growth patterns. A grade of 5 represents the most altered appearance of the cells with large, observable, different shaped masses (Humphrey, 2004). The grades 2-4 represent the range of appearances of the cancer cells between the grades 1 and 5 (Humphrey, 2004). The Gleason Score is calculated by summing the two largest grades assigned to the histological sample of the prostate tissue, generating a value of 2-10 (Humphrey, 2004). Patients with a Gleason Score of 2-6 are candidates for active surveillance, which is essentially just close surveillance of PSA progression without definitive treatment to avoid over-treatment (Shah, 2009). Patients with a Gleason Score of 7 or greater are in need of definitive therapy (Shah, 2009).

Another tool used to assess the extent of the cancer is the Tumor-Node-Metastasis (TNM) staging system. The TNM cancer staging system is used to assign a stage to cancerous prostatic samples (Edge & Compton, 2010). The TNM outlines the location of the cancer in relation to the prostate gland and the rest of the body. The letter T in the TNM score denotes that there is a tumor in the prostate. The letter N in the TNM score signifies a tumor in a lymph node, and the letter M indicates metastasis in other locations in the body. A common score is T2a, which indicates a tumor involving one half a prostatic lobe or less. The TNM staging can be diagnosed from a TRUS biopsy, or by palpation of the prostate via rectal exam (Edge & Compton, 2010).

Treatment of Prostate Cancer

Definitive Treatment Options

Surgical removal of the prostate is a common procedure used to treat prostate cancer. The surgical techniques of prostatectomies have evolved in the last two decades from the traditional Radical Retropubic Prostatectomy (RRP) which was considered the gold standard treatment for prostate cancer (Coelho et al., 2010). A RRP is an invasive procedure which involves a large open incision in the abdomen and surgical dissection of the prostate (Barré, 2007). New surgical techniques have developed such that laparoscopic dissection (a minimally invasive procedure with a few small incisions) of the prostate can be achieved with the assistance of a da Vinci Robotic Surgical System. This new technology allows surgeons to perform a Robot Assisted Laparoscopic Prostatectomy (RALP) with minimal invasion compared to the open incision of the RRP. RALP operations can be performed as Nerve Sparing (NS) procedures, where the neurovascular bundles are dissected away from the prostate in an attempt to preserve the urinary and sexual function of the patient (Coelho et al., 2010). As there is a neurovascular bundle that runs on both sides of the prostate, a NS procedure can be bilateral where both neurovascular bundles are dissected away, or unilateral if only one is dissected away. The type of NS procedure depends on the girth and location of the tumor, if the tumor extends into the regions of these neurovascular bundles they will not be dissected away in an attempt to remove all cancerous cells (Talcott et al., 1997).

Illustration 4: Surgical Incision Sites for RALP

Illustration by Martin Allums

External Beam Radiation Therapy is another common treatment for prostate cancer. EBRT is radiation delivered from an external source directed at the prostate from different angles to preserve the tissue around the prostate (Heidenreich et al., 2008). If a patient has received a prostatectomy as initial treatment and there is reoccurrence of prostate cancer, they can go on to receive EBRT (Heidenreich et al., 2008). However, once a patient receives EBRT for their initial treatment, they have received a lifetime dose of radiation to that area and are not able to undergo any more radiation treatment for their prostate cancer (Heidenreich et al., 2008).

Another treatment for prostate cancer is Androgen Deprivation Therapy (also referred to as hormone therapy). The growth of most prostate cancer cells is dependent on androgens (sex hormones), most often testosterone or dihydrotestosterone (Miyamoto et al., 2004). To treat prostate cancer, hormone deprivation therapy aims to stop the production of testosterone. This is achieved by either pharmaceutically or surgically castrating the patient, or stopping the body's natural production of androgens (Miyamoto et al., 2004). Androgen deprivation therapy is not a curative treatment, it is used to slow the disease progression and extend patient life (Miyamoto et al., 2004). This therapy is often given to patients who have failed initial treatment of RALP or EBRT who's disease has spread to other areas of the body (Heidenreich et al., 2008).

Descriptions of Specific Treatment

Robotic Assisted Laparoscopic Prostatectomy Procedure

When a RALP is performed, the patient is brought into the operating room that houses the da Vinci robot. The patient is prepped for surgery and sterilized before the procedure begins (Tewari *et al.*, 2002). A small incision is made just above the bellybutton and a tube-like instrument called a port is inserted into the incision (Tewari *et al.*, 2002). Carbon dioxide is pumped into the abdomen through this port to inflate it, giving the surgeon more room to maneuver the surgical tools and a better field of vision (Tewari *et al.*, 2002). Up to six more incisions are made in the abdomen for additional ports—two for the rest of the surgical tools and the rest for the surgical assistant's tools (Tewari *et al.*, 2002). From there, the order of the steps vary, but the structures surrounding the bladder and prostate such as the vas deferens, neurovascular bundles,

and rectum are dissected away from the prostate so that it can be removed (Tewari *et al.*, 2002). The urethra above and below the prostate are severed to free the prostate so it can be removed (Tewari *et al.*, 2002). The severed ends of the urethra are connected with stitches to the bladder to bridge the gap of the now removed prostate (Tewari *et al.*, 2002). The prostate is removed from the abdomen in a small baggie, and the skin and fascia are sutured closed to complete the procedure (Tewari *et al.*, 2002).

External Beam Radiation Therapy

EBRT is produced via a machine that delivers radiation to a specific location in the body. For EBRT, placement of the radiation is essential to make sure both the cancer cells are all killed, and that the non-cancerous organs (such as the bladder) are spared as much radiation damage possible (Zaorsky *et al.*, 1996). OUI uses Image-Guided Radiotherapy Therapy (IGRT) to help maintain the specific location of radiation (Zaorsky *et al.*, 1996). Prior to EBRT, OUI patients have 2 gold fiducial makers placed in their prostate. Visualizing these markers with imaging helps create and maintain a consistent specific location for radiation to be delivered during each treatment session (Zaorsky *et al.*, 1996). The entire radiation treatment is delivered in doses, usually lasting about 15 minutes per day for about 8-9 weeks (Zaorsky *et al.*, 1996). The treatment course is long because only a small amount of radiation can be safely tolerated every day.

Oregon Urology Institute

Oregon Urology Institute (OUI) is the largest and most advanced urologic center in the Northwest. In 2006, the local hospital McKenzie Willamette purchased a da Vinci

robot, which was fairly new technology and on the verge of becoming much more prevalent in the medical field. With the procurement of this machine OUI hired Dr. David DiMarco, who is a surgeon trained on the use of this robot, to perform RALPs. As this was fairly new technology and the RALP was less prevalent, the procedure was more expensive and there were issues with insurance covering the cost for patients. To determine whether surgeries performed with the da Vinci robot lead to better surgical outcomes than conventional methods, OUI developed a Prostate Cancer database.

Originally, data was collected comparing RRP to RALP in terms of blood loss and other direct surgical comparisons to measure whether the RALP had significantly better surgical outcomes. Later, Health-Related Quality of Life (HRQOL) questionnaires were added to the database to track HRQOL in patients with RRP and RALP after treatment. EPIC questionnaires were used to assess urinary, bowel, sexual, and hormonal function as well as patient satisfaction. In 2008, this HRQOL protocol was extended to radiation patients. OUI has tracked HRQOL data for 11 years for prostatectomy patients, and 9 years for EBRT patients.

Introduction

Treating prostate cancer while attempting to maintain a high quality of life in terms of urinary and sexual function is difficult, as nerves that supply the urethra and penis are contained in neurovascular bundles that run posterior-laterally along the prostate (Walsh et al., 1983). Surgical removal or radiation of the prostate can damage these nerves and have a severe impact on urinary and sexual function of patients after treatment, which can lead to a lower quality of life (Walsh et al., 1983). Quality of life for patients being treated for prostate cancer is a major factor in the decision of which treatment to use. Poorer quality of life due to incontinence and erectile dysfunction can lead to depression, poorer quality of sleep, and lower levels of overall health (Coyne et al., 2008). Thus, assessing which treatment leads to the best quality of life is an important factor in the deciding how to treat prostate cancer.

For cancer that is localized to the prostate, both Robot Assisted Laparoscopic Prostatectomy (RALP) and External Beam Radiation Therapy (EBRT) are considered acceptable treatments (Schreiber *et al.*, 2015). Patient input is essential in the treatment decision, thus randomized-control studies are difficult to perform to determine which treatment has better quality of life outcomes. Researchers have heavily relied on retrospective studies to assess the benefits of one treatment versus another, but these studies often yield no clear distinction. EBRT and RALP are both associated with a decline in Health Related Quality of Life (HRQOL) directly after treatment, but thus far there is no clear indication as to which is the better treatments in terms of the recovery of urinary and sexual function (Miller et al., 2005) (Frank et al., 2007). Many studies that investigate this were performed before 2006 when RALP surgical techniques

became more widespread, and have only compared Radical Retropubic Prostatectomy to EBRT. This study compares recovery of urinary and sexual function using information from the Prostate Cancer HRQOL database in patients that were treated with RALP or EBRT.

Purpose

The purpose of this study was to determine if EBRT results in better sexual and/or urinary function recovery in patients two years after initial treatment compared to RALP.

Hypothesis

I hypothesized that the changes in sexual function EPIC scores would indicate better sexual function recovery for patients treated with EBRT than RALP. I hypothesized that changes in urinary function EPIC scores would indicate better recovery of urinary function in patients treated with RALP than EBRT.

Methods

Patient Selection

This study compared EBRT to RALP, so patients selected for this study were good candidates for both EBRT and RALP at the time of their initial treatment. Almost all patients are good candidates for EBRT, but not all qualify for RALP. Therefore, only EBRT patients that were specifically noted to also qualify for RALP were selected for this study.

Candidacy Criteria for EBRT Patients

Surgical guidelines denote that patients should live long enough to benefit from lack of malignancy. As RALP is an invasive procedure, a patient should have a life expectancy of 10 years or more to receive treatment (Lepor, 2000). Although the probability that a man 70 years old will live 10 more years after prostatectomy is about 58% (Lepor, 2000), Oregon Urology Institute physicians do not discriminate treatment based on age and will select RALP if a patient has an estimated 10 year life expectancy. Thus, patients were selected for this study if it specified in their chart that they are good surgical candidates at the time of their initial treatment consultation. Patients selected had a Gleason Score of 6-8 indicating that they needed initial treatment. Patients with a Gleason score of 9-10 are very high risk and most often receive multiple treatment types such as surgery or radiation with hormone (Fowler, Jr *et al.*, 2000). This possibility of multiple treatments would confound the study results, so these patients were not included. Selected patients had a TNM score in the range of T1a-T3a indicating they

still had organ confined prostate cancer in order to be eligible for prostatectomy (Lepor, 2000).

Candidacy Criteria for RALP Patients

Patients selected had a Gleason Score of 6-8 indicating they needed initial treatment. Selected patients had a TNM score in the range of T1a-T3a indicating they still have organ confined prostate cancer in order to be eligible for prostatectomy (Lepor, 2000). Patients who were selected had a form of a nerve sparing procedure (Bilateral, Right, Split, etc.) to control for poor erectile function.

Data Collection

Sexual and Urinary Function Data

This study examines differences in sexual and urinary function for EBRT and RALP through Oregon Urology Institute's (OUI) Prostate Cancer Database. Measurements for Sexual and Urinary function have been acquired through the Expanded Prostate Index Composite (EPIC). EPIC questionnaires inquire about the patient's urinary, bowel, hormonal, and sexual bother and reflects their urinary, bowel, hormonal, and sexual function respectively (Wei *et al.*, 2000). The EPIC questionnaires relates the scores for each question in a section that are ranked on a 1-5 or 1-4 basis into a percentage that gives a summary of the function for that section. Thus if the top score is selected by the patient for each question in a section such as urinary function, that patient would receive 100 for that section when their EPIC score is calculated. Higher scores represent less bother and better function. The scores recorded for sexual and urinary function were used in this study, and all other information was omitted. A

packet with this questionnaire is sent out to patients willing to participate in the Prostate Cancer Database before their treatment, quarterly for the first year, and then annually. The 2-year time point was chosen to assess recovery of urinary and sexual function as improvement in both generally does not occur past 24 months (Penson *et al.*, 2008) (Donovan *et al.*, 2016).

Treatment Related Information

Many co-variants were included in this study. Smoking status was determined based off of smoking status at time of treatment. Co-morbidities were recorded from conditions recorded in patients' chart at time of treatment. Race was recorded on patient reported race in their chart. Use of hormone therapy was determined from listed medications on the patient's chart. Erectile aid use before and at the two year time point was determined based off medication lists and notes made in the patient's chart. Other information regarding Gleason Score and other biopsy information was recorded from the biopsy pathology report, and the TRUS surgical report. Surgery related information, such as procedures performed and diagnostics, were recorded from the prostatectomy pathology report and the surgical notes.

Data De-identification

Patients were assigned a random three-digit number generated by a random series generator. This number allowed for the data of an individual to stay associated with an individual outcome. No personal health information or identifiers (such as name, birthdate, or surgery dates) were included in the data used for this study. The key that connected this three-digit number to the patients was kept secure.

Statistical Analysis

The patients' clinical presentations were analyzed with Welch's t-test (two tailed t-test with unequal variance). Demographic information, which was included as possible confounding variables, was analyzed with Fisher's exact test. A Wilcoxon rank-sum test was used to compare baseline BMI of patients in each treatment group, as there were not normal distributions. General Linear Models (GLM) were used to assess significant differences between treatment groups, and identify if any variables were confounding the relationship between treatment groups and EPIC scores for Urinary and Sexual function.

Results

Table 1 shows the clinical presentations of each treatment group. The patients in both treatment groups were largely similar. One statistically significant difference was the TNM Stage between the two treatment groups. The RALP treatment group had a slightly higher average TNM staging of T2b than the EBRT group's T2a.

Patient Demographics

	EBRT		RALP	
	Average	Mode	Average	Mode
Age at start of tx (yr)	66 SD: 7	59	64 SD: 6.8	68
PSA Level (ng/mL)	5.7 SD: 3	5.5	6.1 SD: 4.3	5.5
Prostate Size (mL)	43 SD: 15.8	-	39.8 SD: 20.2	33
Gleason Score	6.4 SD: 0.5	6	6.6 SD: 0.7	6
1st Grade	3.1 SD: 0.3	3	3.2 SD: 0.4	3
2nd Grade	3.3 SD: 0.5	3	3.4 SD: 0.5	3
Biopsies (% of positive samples)	35.6 SD: 22.4	25	35 SD: 20.4	33
Highest % of Cores	49 SD: 28.7	80	46 SD: 29.9	80
Clinical TNM Stage*	t2a	t1c	t2b	t2c
BMI	29.1 SD: 4.4	-	27.9 SD: 3.9	25.9

Table 1: Comparison of Clinical Presentations for EBRT and RALP Patients

*Statistically significant with Welch's T-test $p < .05$.

Fisher's exact test revealed significant differences in the amount of cardiac disease between treatment groups. The EBRT group had more instances of cardiac disease, with 41% of the patients with cardiac disease. This prevalence of a disease, which influences the patient's overall health, denotes that the EBRT patient group was generally less healthy than the RALP group. Fisher's exact test revealed statistically significant differences in the number of patients treated with hormone therapy between groups during the time interval this study analyzed. The EBRT group had more patients (16% vs. 1%) treated with hormone therapy within the two-year interval post initial treatment. As there is decreased libido as well as other symptoms related to the use of hormone therapy, the patient's sexual function EPIC scores could be affected by this treatment. The demographic categories of race and use of erectile aid were not included in the GLM analysis due to an unacceptable amount of missing data.

	Number of Patients (%)

Statistical Tests

Figure 1 shows the distribution of urinary change scores for EBRT and RALP. The unadjusted GLM model illustrated in Table 3 had an overall F value of 0.52. This F value is not less than 0.05, suggesting that this model is not a successful fit so an adjusted model was run.

Figure 1: Distribution of Urinary EPIC Score Change

In this figure, 0 denotes baseline. As 2yr scores were subtracted from pre-treatment scores, negative scores indicate improvement from initial urinary function and positive scores represent a worsening from initial urinary function.

Unadjusted GLM Model		
Mean	R²	Pr > F
-1.22	0.003	0.52
	Estimate	Pr > t
Intercept	-1.79	0.35
EBRT	2.71	0.52
RALP	0.00	

Table 3: Reported Values from the Urinary Function Unadjusted GLM Model

Table 4 shows the reported values of the fully adjusted GLM model that included possible confounding variables. The variables that were found to confound the association (to have an effect on change in urinary EPIC score independent of treatment group) of study variables were cardiac disease, arterial disease, age, BMI, smoking, hypertension, and hormone treatment. None of these variables were found to modify the association (act in association with treatment group to affect urinary EPIC score) of study variables. The F-value for the fully adjusted GLM model was 0.0076 indicating a good fitting model. The R² value generated by this analysis was 0.18. This indicates that the treatment groups and all of the confounding variables explain 18% of the variation in urinary change for all the patients included in this analysis. EBRT had 4.45 greater increase in urinary change score than RALP, indicating a worsening in urinary function from baseline (as positive values represent a worsening in function). This association is not statistically significant with a p-value of 0.40. Thus, no statistically significant change was detected between urinary score change for EBRT and RALP. The mean of all patients included in the GLM procedure was -0.81. As this value is negative, it

shows that there was a general improvement of urinary function in men treated for prostate cancer with either treatment.

Adjusted GLM Model		
Mean	R²	Pr > F
-0.81	0.18	0.0076
	Estimate	Pr > t
Intercept	10.19	0.61
EBRT	4.45	0.41
RALP	0.00	

Table 4: Reported Values from the Urinary Function Fully Adjusted GLM Model

Figure 2 shows the unadjusted GLM model of change in sexual function from pre-treatment to 2 years post treatment. The F-value reported in Table 5 for this model was 0.012 indicating the model was a good fit. The R² value is 0.05 indicating, 5% of the variation in change sexual function from pre-treatment to 2 years is explained by type of treatment. The difference in change for patients undergoing EBRT was -11.9, which was statistically different (p = 0.01). As negative numbers represent an improvement in sexual function from baseline, this indicates that EBRT patients had better sexual function than RALP patients.

Figure 2: Distribution of Sexual EPIC Score Change

In this figure, 0 denotes baseline. As 2yr scores were subtracted from pre-treatment scores, negative scores indicate improvement from initial urinary function and positive scores represent a worsening from initial urinary function. *Indicates a statistically significant difference ($p < 0.05$)

Unadjusted GLM Model		
Mean	R ²	Pr > F
15.94	0.052	0.012
	Estimate	Pr > t
Intercept	18.34	<.0001
EBRT	-11.88	0.012
RALP	0.00	

Table 5: Reported Values from Sexual Function GLM Unadjusted Model

The fully adjusted GLM procedure was performed which included hormone treatment in the analysis, as it was found to confound the relationship between treatment group and change in EPIC sexual function score. It was found that hormone treatment did not modify the association (act in conjunction with type of treatment) to affect change in EPIC score. The F value for the fully adjusted GLM model shown in Table 6 was 0.028, demonstrating a model of good fit. The R^2 value was 0.06, which indicates that treatment group can explain 6% of the variation in change in sexual function from baseline to 2 years. The difference in change between the EBRT patients and the RALP patients was -10.4, which is a statistically significant difference ($p = 0.04$). As negative numbers represent an increase in function, EBRT patients have better sexual function than RALP patients.

Adjusted GLM Model		
Mean	R²	Pr > F
15.94	0.06	0.028
	Estimate	Pr > t
Intercept	18.43	<.0001
EBRT	-10.42	0.036
RALP	0.00	

Table 6: Reported Values from Sexual Function Fully Adjusted GLM Model

Discussion

This study compared RALP to EBRT in terms of urinary and sexual function change from pre-treatment. The purpose of this comparison was to determine if either treatment provided better outcomes for patients. It was hypothesized that RALP patients would have better improvement urinary function, and EBRT would have better improvement sexual function.

No significant difference was identified between the treatments for change in urinary function at the two-year time point. This indicates that neither is superior at preserving urinary function. The mean of all of the patients included in the analysis of urinary function was negative. This indicates that in general, all patients who undergo treatment for prostate cancer have improved urinary function from before their initial treatment. This study's finding of no significant difference between urinary change and treatment groups does not coincide with a study performed by Chien in 2017. This study found that urinary function was significantly worse in RALP patients compared to other treatments such as EBRT (Chien *et al.*, 2017). As there are still few studies that compare RALP to EBRT these conflicting findings cannot be reconciled.

This study also uncovered an interesting finding that could help explain variation in urinary change scores for patients treated for prostate cancer. The analysis of urinary function found that arterial disease is significantly associated with a greater urinary change score compared to no artery disease ($p = 0.001$). This suggests that artery disease may be a better predictor of loss of urinary function after prostate cancer treatment than treatment type. Further investigation into this relationship between urinary function and arterial disease is warranted to distinguish if arterial disease should

be taken into account in the treatment decisions for patients when attempting to preserve urinary function.

A significant difference was found in the change in sexual function scores between treatment groups. The EBRT patients had a difference in change of -10.4 from the RALP patients. As negative numbers indicate an improvement in function, EBRT patients' sexual function improved when compared to RALP patients ($p = 0.04$). This indicates that EBRT is the superior treatment in the preservation sexual function. These findings agree with Chein's 2017 study that found EBRT patients had better sexual function when compared to RALP patients.

This study has limitations that affect the conclusions that are drawn. As this study was performed with self-report EPIC questionnaires, there is the chance that the answers the subjects provided are not an accurate representation of their urinary or sexual function. This study also contained a much smaller sample size of EBRT patients compared to RALP patients. This was due to extensive missing data in pre-treatment scores for patients treated with EBRT. This missing data likely results from differences in EPIC packet distribution practices at the location where patients receive EBRT. This study also relied heavily on data in patient charts for assessment of confounding variables. If these charts were not updated or did not contain the information gathered by this study, the affect of these confounding variables determined in this study could be inaccurate. As was mentioned, there was extensive missing data in erectile aid use and race. A study that was designed to collect this information in a more reliable way, rather than relying on information included in a patient's chart, would be able to assess confounding variables to a more accurate degree. The diversity of patients is also a

limitation in this study because the demographic was largely white men. A study that included a larger representation of the diversity or the populations would be able to draw more extensive conclusions.

This is one of the first studies that compare RALP to other treatments. More studies that compare RALP to other treatments are needed to assess which treatment will best suit patient needs. As use of erectile aids was not able to be included in this analysis due to extensive missing data, studies that analyze the role of erectile aid use in sexual function change after prostate cancer treatment should be conducted to evaluate how they affect the change in sexual function in relation to treatment type.

This study will add to the growing field of knowledge of the benefits of different prostate cancer treatments. It supports that EBRT is a better therapy for preserving sexual function, and informs that either treatment will preserve urinary function to a similar degree.

Conclusion

Health related quality of life in terms of urinary and sexual function varies by treatment. EBRT was a better treatment for preserving sexual function, but neither treatment is better for preserving urinary function in this study. This study adds to the information about different prostate cancer treatments, and allows for the possibility that treatments can be specified to a patient's needs to create the best quality of life after surgery that can be achieved.

Appendix B: EPIC Questionnaire

Dear Patient,

Quality assurance and scientific advancement are very important in the treatment of prostate cancer. In an effort to improve patient outcomes and clinical care, we are enclosing 3 questionnaires related to your health and quality of life after treatment. You should have received a similar document at the time your treatment was scheduled.

We will mail you new copies of the enclosed forms to fill out every three months for the first year and then annually thereafter.

All data returned to us is kept separate from your medical record. If you wish for us to submit this questionnaire to your doctor, please note this on the forms you return. Please understand that it is your responsibility to pursue follow up contact if you would like something on these questionnaires to be addressed.

Every patient has the right to not participate. Your care will not be affected by whether you choose to participate or not.

We have included a self-addressed and stamped envelope in this packet to return the questionnaires. If you have any questions please call our Community Outreach Department at 541-284-5508

Sincerely,

Oregon Urology Institute

Prostate Cancer Support Groups

Meets first Wednesday of every
month at our Radiation Center

1457 G Street, Springfield, OR

5:30 pm – 7:00 pm

For more information, please visit our
website at

www.oregonurology.com

EPIC

The Expanded Prostate Cancer Index Composite

This questionnaire is designed to measure Quality of Life issues in patients with Prostate cancer. To help us get the most accurate measurement, it is important that you answer all questions honestly and completely.

Remember, as with all medical records, information contained within this survey will remain strictly confidential.

Today's Date (please enter date when survey completed): Month _____ Day _____ Year _____

Name (optional): _____

Date of Birth (optional): Month _____ Day _____ Year _____

Printed with permission from Dr. David Woods, University of Michigan, March, 2007.

URINARY FUNCTION

This section is about your urinary habits. Please consider **ONLY THE LAST 4 WEEKS.**

- 1. Over the **past 4 weeks**, how often have you leaked urine?
 - More than once a day 1
 - About once a day..... 2
 - More than once a week 3 (Circle one number) 23/
 - About once a week..... 4
 - Rarely or never..... 5

- 2. Over the **past 4 weeks**, how often have you urinated blood?
 - More than once a day 1
 - About once a day..... 2
 - More than once a week 3 (Circle one number) 24/
 - About once a week..... 4
 - Rarely or never..... 5

- 3. Over the **past 4 weeks**, how often have you had pain or burning with urination?
 - More than once a day 1
 - About once a day..... 2
 - More than once a week 3 (Circle one number) 25/
 - About once a week..... 4
 - Rarely or never..... 5

- 4. Which of the following best describes your urinary control **during the last 4 weeks**?
 - No urinary control whatsoever 1
 - Frequent dribbling..... 2 (Circle one number) 26/
 - Occasional dribbling..... 3
 - Total control 4

5. How many pads or adult diapers per day did you usually use to control leakage **during the last 4 weeks?**

- None 0
- 1 pad per day..... 1
- 2 pads per day..... 2 (Circle one number)
- 3 or more pads per day 3

27/

6. How big a problem, if any, has each of the following been for you **during the last 4 weeks?**
(Circle one number on each line)

	<u>No Problem</u>	<u>Very Small Problem</u>	<u>Small Problem</u>	<u>Moderate Problem</u>	<u>Big Problem</u>	
a. Dripping or leaking urine	0	1	2	3	4	28/
b. Pain or burning on urination.....	0	1	2	3	4	29/
c. Bleeding with urination.....	0	1	2	3	4	30/
d. Weak urine stream or incomplete emptying	0	1	2	3	4	31/
e. Waking up to urinate	0	1	2	3	4	32/
f. Need to urinate frequently during the day.....	0	1	2	3	4	33/

7. Overall, how big a problem has your urinary function been for you **during the last 4 weeks?**

- No problem1
- Very small problem2
- Small problem.....3 (Circle one number)
- Moderate problem4
- Big problem5

BOWEL HABITS

The next section is about your bowel habits and abdominal pain.
Please consider **ONLY THE LAST 4 WEEKS.**

8. How often have you had rectal urgency (felt like I had to pass stool, but did not) **during the last 4 weeks?**

- More than once a day.....1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

42/

9. How often have you had uncontrolled leakage of stool or feces?

- More than once a day.....1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

43/

10. How often have you had stools (bowel movements) that were loose or liquid (no form, watery, mushy) **during the past 4 weeks?**

- Never1
- Rarely.....2
- About half the time3 (Circle one number)
- Usually4
- Always.....5

44/

11. How often have you had bloody stools **during the past 4 weeks?**

- Never1
- Rarely.....2
- About half the time3 (Circle one number)
- Usually4
- Always.....5

SEXUAL FUNCTION

The next section is about your **current** sexual function and sexual satisfaction. Many of the questions are very personal, but they will help us understand the important issues that you face every day. Remember, THIS SURVEY INFORMATION IS COMPLETELY **CONFIDENTIAL**. Please answer honestly about **THE LAST 4 WEEKS ONLY**.

17. How would you rate each of the following during the last 4 weeks? (Circle one number on each line)

	Very Poor to <u>None</u>	<u>Poor</u>	<u>Fair</u>	<u>Good</u>	Very Good	
a. Your level of sexual desire?	1	2	3	4	5	56/
b. Your ability to have an erection?.....	1	2	3	4	5	57/
c. Your ability to reach orgasm (climax)?	1	2	3	4	5	58/

18. How would you describe the usual **QUALITY** of your erections **during the last 4 weeks?**

None at all.....	1					
Not firm enough for any sexual activity	2					
Firm enough for masturbation and foreplay only	3					(Circle one number) 59/
Firm enough for intercourse	4					

19. How would you describe the **FREQUENCY** of your erections **during the last 4 weeks?**

I NEVER had an erection when I wanted one.....	1					
I had an erection LESS THAN HALF the time I wanted one.....	2					
I had an erection ABOUT HALF the time I wanted one.....	3					(Circle one number) 60/
I had an erection MORE THAN HALF the time I wanted one.....	4					
I had an erection WHENEVER I wanted one	5					

20. How often have you awakened in the morning or night with an erection **during the last 4 weeks?**

Never	1					
Less than once a week.....	2					
About once a week.....	3					(Circle one number) 61/
Several times a week.....	4					
Daily.....	5					

21. During the last 4 weeks, how often did you have any sexual activity?

- Not at all1
- Less than once a week.....2
- About once a week.....3 (Circle one number)
- Several times a week.....4
- Daily5

62/

22. During the last 4 weeks, how often did you have sexual intercourse?

- Not at all1
- Less than once a week.....2
- About once a week.....3 (Circle one number)
- Several times a week.....4
- Daily5

63/

23. Overall, how would you rate your ability to function sexually during the last 4 weeks?

- Very poor1
- Poor2
- Fair.....3 (Circle one number)
- Good.....4
- Very good.....5

64/

24. How big a problem, during the last 4 weeks, if any, has each of the following been for you?

(Circle one number on each line)

	<u>No Problem</u>	<u>Very Small Problem</u>	<u>Small Problem</u>	<u>Moderate Problem</u>	<u>Big Problem</u>	
a. Your level of sexual desire.....	0	1	2	3	4	65/
b. Your ability to have an erection ...	0	1	2	3	4	66/
c. Your ability to reach an orgasm...	0	1	2	3	4	67/

25. Overall, how big a problem has your sexual function or lack of sexual function been for you during the last 4 weeks?

- No problem.....1
- Very small problem.....2
- Small problem.....3 (Circle one number)
- Moderate problem4
- Big problem5

HORMONAL FUNCTION

The next section is about your hormonal function. Please consider **ONLY THE LAST 4 WEEKS.**

26. **Over the last 4 weeks**, how often have you experienced hot flashes?

- More than once a day1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

69/

27. How often have you had breast tenderness **during the last 4 weeks?**

- More than once a day1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

70/

28. **During the last 4 weeks**, how often have you felt depressed?

- More than once a day1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

71/

29. **During the last 4 weeks**, how often have you felt a lack of energy?

- More than once a day1
- About once a day.....2
- More than once a week3 (Circle one number)
- About once a week.....4
- Rarely or never.....5

72/

30. How much change in your weight have you experienced **during the last 4 weeks**, if any?

- Gained 10 pounds or more.....1
- Gained less than 10 pounds.....2
- No change in weight3 (Circle one number)
- Lost less than 10 pounds4
- Lost 10 pounds or more5

RE: Protocol entitled, "Protecting the P"

Notice of Review and Determination-Not Human Subject Research as per Title 45 CFR Part 46.102 (d-f)

Research Compliance Services has reviewed the proposed project identified above. Based on the project description and materials provided, the study activities do not meet the definition of research with human subjects according to Title 45 CFR 46.102 (d-f).

You may conduct your activities as described without further IRB review. However, should the nature of your interactions with individuals or the nature of your project aims be modified, you will need to contact Research Compliance Services to determine if further review and approval is required by the University of Oregon Institutional Review Board (IRB).

Should you have any questions regarding this determination, please contact Research Compliance Services at ResearchCompliance@uoregon.edu or (541)346-2510.

Sincerely,

A handwritten signature in black ink, appearing to read 'Carolyn J. Craig'.

Human Subjects Research Determination Worksheet

Purpose: It is against federal regulations to conduct research involving human subjects without prior Institutional Review Board (IRB) approval. The purpose of this worksheet is to help you determine and record whether or not your project constitutes research involving human subjects, according to regulatory definitions of these terms.

Special Considerations:

- If your study involves human biological or genetic material, or repositories, please contact Research Compliance Services (RCS) for specific instructions (the information provided in this worksheet may not apply to your research).
- In general, activities undertaken for the fulfillment of a single course requirement and not the development of or contribution to generalizable knowledge (e.g., public presentation or publication) do not require IRB review.

Instructions: Complete this worksheet to determine whether or not your research is human subjects research and therefore requires review and approval by (RCS) and the IRB.

If your answers reveal that your project **is** human subjects research, you must complete and submit an IRB application (available on the [RCS website](#)) prior to commencing any interaction with human subjects.

If your answers reveal that your project **is not** human subjects research, you do not need to submit an IRB application to RCS, but you should keep this worksheet with your records. If you would like a formal letter from RCS documenting that your project is not human subjects research, complete the supplemental information requested on the last page and submit it with your answers to RCS.

If you have any questions, please contact RCS at 541-346-2510 or ResearchCompliance@uoregon.edu. Before proceeding, save this form to your computer.

Part I: Determination of research. (45 CFR 46.102)

> Human subjects research regulations apply only to activities that meet the federal definition of **research**, defined as “a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge.” Answer questions 1 and 2 below to determine whether or not your project meets this definition of research.

1. Is the study a **systematic** investigation? **Systematic** means having or involving a system, method, or plan.

Examples of studies that are systematic include, but are not limited to, those which:

- Gather data for the purpose of hypothesis building or testing.
- Ask individuals the same sets of questions, or obtain the same kind of information from them.
- Apply the same measures in gathering the data – whether through interaction, observation, or experiment.
- Utilize data collection methods that can be replicated.

Yes No

Explain your answer: The study uses data that was collected with methods that can be replicated.

Human Subjects Research Determination Worksheet

Part I: Determination of research. (45 CFR 46.102)

2. Is the study designed to contribute to **generalizable knowledge**?

- Your study contributes to generalizable knowledge if you intend for findings from it to be applicable to a larger population, or otherwise make the findings of it available for the development of knowledge beyond the scope of the study.
- If the study activities involving people are conducted solely for the purpose of fulfilling a course requirement, they are not considered research because they are not designed to contribute to general knowledge. However, activities involving people that are conducted in conjunction with the requirements of a thesis or dissertation generally are research because the purpose of the thesis or dissertation is by definition to make a contribution to general knowledge.

Yes No

Explain your answer: It will contribute to general knowledge about prostate cancer treatments.

- ✓ If you answered "No" to **either** question 1 **or** 2, STOP - you do not need to complete the rest of this form. Your study is not considered research.
- ✓ If you answered "Yes" to questions 1 **and** 2, continue to Part II.

Part II: Determination of human subjects. (45 CFR 46.102)

➤ Human subjects protection regulations apply only to research involving **human subjects**, defined as "living individuals **about whom** an investigator (whether professional or student) conducting research obtains: (1) data through intervention or interaction with the individual; or (2) identifiable private information." Answer the questions below to determine if your research involves human subjects.

3. Does the research involve information about or from living individuals?

Information involving or about an individual includes, but is not limited to, the following:

- Ideas, attitudes, opinions, feelings, experiences, thoughts, beliefs, assessments, reflections, etc., reported by an individual, even when the individual provides the information while working in a professional capacity.
- Data about living individuals that was gathered by another researcher or source.
- Data about living individuals gathered through the use, analysis or harvesting of cell lines, tissue, or the products of labor and delivery.

Yes No

Explain your answer: Data is collected from patients treated for prostate cancer.

Human Subjects Research Determination Worksheet

Part II: Determination of *human subjects*. (45 CFR 46.102)

- ✓ If you answered "No" to question 3, STOP - you do not need to complete the rest of this form. Your project is not considered research involving human subjects.
- ✓ If you answered "Yes," continue to questions 4 **and** 5 below.

4. Does the research involve obtaining data through ***intervention*** or ***interaction*** with individuals? ***Intervention*** or ***interaction*** includes the following:
- Physical procedures by which data are gathered (e.g., drawing blood from subjects, timing subjects running laps, recording brain activity during sleep, etc.).
 - Manipulations of the subject or the subject's environment that are performed for research purposes.
 - Communication or interpersonal contact between investigator and subject (e.g., a street interview, an online survey, recording posts on a blog or listserv, a mailed questionnaire, etc.).

Yes No

Explain your answer: Study involves questionnaires

5. Will you obtain ***private information*** about any subjects? ***Private information*** is explained as follows:
- Information about behavior that occurs in a context in which an individual can reasonably expect that no observation or recording is taking place.
 - Information which has been provided for specific purposes by an individual and which the individual can reasonably expect will not be made public (e.g., a medical record, emails, certain listserv communications, class papers and exams, etc.).
 - Private information must be individually identifiable, meaning:
 - o the identity of the subject is or may readily be ascertained by the investigator, **or**
 - o the identity of the subject is or can be associated with the information directly or through links to identifiable information.

Yes No

Explain your answer: Identity of the subject will not be able to be obtained.

- ✓ If you answered "No" to questions 4 **and** 5, STOP - you do not need to complete the rest of this form.
- ✓ If you answered "Yes" to ***either*** question 4 **or** 5, your project **does** involve human subjects and you must complete an IRB application (available on the RCS website).

Human Subjects Research Determination Worksheet

Part III: What's Next?

- ✓ If your answers indicate that your project does involve human subjects research, you must complete and submit an [IRB application](#). IRB approval is required before any research activities – including recruitment – with human subjects may begin. Complete and submit an application according to instructions provided on the application.
- ✓ If your answers reveal that your project is not human subjects research, keep a copy of this worksheet with your records.
- ✓ If you would like a formal letter from RCS documenting that your project is not human subjects research, please provide the supplemental information requested on the next page and submit it with your answers above to RCS.
- ✓ If you are not sure if your project is human subjects research or if you have any questions, contact RCS at 541-346-2510 or ResearchCompliance@uoregon.edu.

Human Subjects Research Determination Worksheet

Instructions: Complete the following and submit to researchcompliance@uoregon.edu if you would like a formal letter from RCS documenting that your project is not human subjects research. If your answers above indicate that your project involves human subjects, please fill out an [application](#) for IRB review.

Principal Investigator (PI)	Julia Fischer	PI Email	jfischer@uoregon.edu
Department or Institution	Oregon Urology Institution	Are You? (choose one)	Choose an Item
Faculty Advisor (required for students)	Dr. Carrie McCurdy	Faculty Advisor Email	cmccurd5@uoregon.edu
Study Title	Protecting the P		

1. Briefly describe the project, and what you expect to do with your findings:

This study looks at different treatments for prostate cancer and how they affect quality of life related outcomes. It specifically looks at urinary and erectile function and whether treatment External Beam Radiation Therapy or Robot Assisted Laparoscopic Prostatectomy provides better outcomes for patients. This study may provide information about which treatment would be better to preserve urinary and sexual function for men treated with prostate cancer. The findings will be used to create my Honors College Thesis.

2. Briefly describe the study population or subject of the research:

The study population is patients treated for prostate cancer at Oregon Urology Institute who have filled out questionnaires asking about their quality of life. In general, the demographics of the subjects are white males ages 60-70.

3. Briefly describe the data collection methods to be used:

EPIC Questionnaires that ask about quality of life are sent out to patients before their treatment and at different time periods after their treatment. Their answers are recorded in a database along with information about their treatment. The information used for this study was provided from that database with no pieces of personal health information (such as names of any dates) included. It is essentially just a table of numbers. The only way the data is connected to an individual patient is by a number randomly assigned to them to keep track of which information belongs with which value. I will not have access to the key that connects these numbers to the individual so the information in this study cannot be linked back to the individual. Essentially, the data used is just a bunch of values that relate to a quality of life outcome from an unidentifited individual.

Julia,

Attached is our finalized 'Policy'. As for the clarification below, yes as you know, we do have safeguards in place identifiable information isn't release to you or anyone else, even our physicians.

If you need anything else let me know,
Stephanie

POLICY

Date: February 27, 2017
From: Oregon Urology Institute, Executive Council
Re: EPIC Database (Expanded Prostate Cancer Index Composite)

In regards to OUI's EPIC Database, please see the following internal review/determination as to the data already collected.

We have concluded that this project was/is a quality improvement project. As such it does not meet the definition of human research as per 45 CFR 46.102(d)¹.

For example the OHRP Guidance we reviewed in our determination:

Question 2: Do the HHS regulations for the protection of human subjects in research (45 CFR part 46) apply to quality improvement activities conducted by one or more institutions whose purposes are limited to: (a) implementing a practice to improve the quality of patient care, and (b) collecting patient or provider data regarding the implementation of the practice for clinical, practical, or administrative purposes?

Answer: No. Such activities do not satisfy the definition of "research" under 45 CFR 46.102(d), which is "...a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge..." Therefore the HHS regulations for the protection of human subjects do not apply to such quality improvement activities, and there is no requirement under these regulations for such activities to undergo review by an IRB, or for these activities to be conducted with provider or patient informed consent.

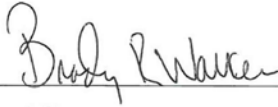

To further assure confidentiality of the EPIC data base the following is in place:

1. No Oregon Urology Institute Provider will have access to the full database.
2. Database will be overseen by the Director of Community Outreach.
3. Director of Community Outreach will not use data from database for any reason (i.e. presentation/publication, etc).
4. Database will be password protected.
5. Limited number of staff/interns will have secure access granted by the Director of CO.
6. Any changes in staffing, the password will be changed.

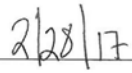

7. Database will be kept on a secure server with limited access as aforementioned.
8. Information collected via paper EPIC forms will not have patient name, DOB. A unique identifier will be on form so that staff/interns who are given secure access will be able to assure data is entered into correct timeline (ex. pre-surgery, post-radiation, 3 year post treatment).
9. Any data shared with a Provider will be double checked by two staff assuring that no identifiers or PHI are included.
10. Any data shared from the database will not contain PHI that could be directly traced to a patient who shared their quality of life information.
11. This policy will not require re-review unless changes are made/needed.
