Preserve the integrity of actual and potential bald eagle winter roost sites. Utilize the findings and recommendations of a bald eagle winter roost survey, conducted by the Oregon Cooperative Wildlife Research Unit in 1986 through 1987. See Bald Eagle Management Prescription (Management Area 12-Eagle Roosting Areas), Section 2, this chapter.

**Rocky Mountain Elk and Mule Deer**

Big game capability models should be used in project planning to determine habitat effectiveness (HE), as affected by quality and quantity of cover and forage, and open road density. Resulting HE values will be compared with those predicted for future outputs, to determine whether or not big game objectives are being met. Specific actions should be taken when project alternatives chosen for implementation are shown to reduce HE values below those predicted over the planning horizon. See management area standards and guidelines for Wildlife and Fish, this chapter for predicted HE values and specific actions to take. Also see Chapter 5, Implementation of the Forest Plan, for monitoring requirements.

The model used to predict the influence of forest management on elk is a Habitat Effectiveness model. It is a biologically based model that tells us how effective an area will be in supporting elk. The model was designed to measure effectiveness on a scale of 0 to 180, with 180 representing the highest potential effectiveness and 0 representing the least desirable situation for elk. It is intended to be only a relative measure of effectiveness, and does not consider many factors that would influence the actual number of elk found in an area. These additional factors include the effects of hunting, predators, disease, yearly changes in weather and forage production, competition with other animals, and the rate at which elk populations can change from one level to another.
To make the results of the model easier to interpret, the effectiveness index was translated into a number of animals that could be supported on an area. This was done by estimating the density of animals that could be supported on an area if the habitat were maintained at optimum effectiveness. It was then assumed that a habitat effectiveness value of 180 translated to this highest possible density of elk, and that lower values would translate to proportionally lower densities. The numbers shown in this document (see objectives for Wildlife and Fish, Section 1, this chapter) are those numbers of elk that could potentially be supported on the area. The numbers are not projections of actual elk populations. As noted above, many additional factors would have to be considered in order to project actual elk populations. It is especially important to note that the current elk numbers on an area may not be the direct result of factors that are measured in the habitat effectiveness model. The current population in an area could be limited by the availability of winter range on private land, by hunting pressure, or by any of the other factors discussed above. In this case, habitat effectiveness might decline but have no real influence on the number of elk that occupy the area, or habitat effectiveness might increase but still have no net influence on the number of elk. Because the numbers shown as outputs in Section 1, Goals, Objectives and Desired Future Condition, for Wildlife only represent habitat effectiveness, it is important to read the full text in order to understand the effect of forest management on the elk population.

Protect the character of elk calving sites. Minimize disturbance from human activity during calving season (approximately May 15 to June 30). Also protect wallows during rutting season (September 1 to October 15).

Provide forage sufficient to meet management objectives for population levels of Rocky Mountain elk and mule deer (see Management Objectives for Wildlife and Fish, Section 1, this chapter).

**Rainbow Trout, Brook Trout, Steelhead**

Provide habitat by managing as per riparian prescriptions (Management Area F15-Riparian, Management Area Prescriptions, Section 2, this chapter).

**Threatened, Endangered, and Sensitive Plant and Animal Species**

Inventory and protect threatened and endangered species and their habitat(s).

Cooperate with State and Federal fish and wildlife agencies in developing and implementing recovery plans for threatened or endangered species.

Consult with the U.S. Fish and Wildlife Service when conflicts between project activities and habitat needs cannot be resolved, or when uncertainty exists.

Maintain inventories of essential or critical habitats including their locations and distribution.
Maintain contacts with Federal, State, and other agencies, groups, and individuals concerned with the management of threatened, endangered, and sensitive species. Consult with the Oregon Department of Fish and Wildlife, Oregon Natural Heritage Data Base and U.S. Fish and Wildlife Service for technical assistance in developing species management guides and in determining viable population levels.

During environmental analysis of each project activity, available habitat, location records, and other information should be reviewed to determine whether known or suspected locations of sensitive species or their habitat occur.

If no suitable habitat or reported locations of sensitive species are identified, these findings should be documented, and no further investigation is required.

When suitable habitats or reported locations are suspected to occur in the area of influence of the project, a field reconnaissance will be performed to more precisely verify the presence, abundance, and distribution of the sensitive species. If the search is conducted during a season of the year when positive identification is probable and no listed species are found, this fact should be documented and no further investigation is needed.

If listed species are found in the project influence area, their actual distribution and current status will be determined. Informal consultation with the Endangered Species Branch of the Fish and Wildlife Service will be initiated if the species is Federally listed. If the proposed project would jeopardize the existence of the species it would be modified or curtailed.

Identified safeguards will be clearly spelled out in the environmental analysis and project plan and project personnel will be fully responsible for being aware of and implementing them. Supervision of the activity must assure that actions which jeopardize the listed species do not occur.

If actions which may adversely affect habitat for Federally listed endangered or threatened species cannot be avoided, the activity will be deferred until formal consultation with the Endangered Species branch of the Fish and Wildlife Service is completed to determine a course of action.

In cases where other high values or uses would be foregone if the proposed activity were modified or deferred, a full investigation of the species involved may be conducted. Management guidelines will be developed that will make possible an assessment of the significance of the specific population involved. Based on these findings and consultation with appropriate state and federal agencies, a course of action will be determined.

Coordinate with the Native Plant Society of Oregon to exchange information on local plant distributions and status.

An updated list of Threatened, Endangered and Sensitive species (1989) is shown in Appendix C.
Other Species

Antelope
Manage antelope habitat on the Forest in accordance with Oregon Department of Fish and Wildlife population objectives. Population control necessitated by conflicts will also be dealt with by that agency.

Raptor Habitat
Protect active bird of prey nests from human disturbance until nesting, feeding, and fledging are completed. Provide protection of nest sites and nesting habitat sufficient for the species involved.

Bald and Golden Eagles
Nesting sites, and roosting sites used in conjunction with nesting sites, will be protected under the “Act for Protection of Bald and Golden Eagles” ref. title 50 CFR, USC 668-668d.

Nesting
Eagle nesting territories are divided into primary and secondary management zones.

Primary
The boundary of the primary zone shall not be less than 20 chains from the nest.

Human activities should be controlled during the critical period. The critical period is the time between arrival of adults at the nest site and three weeks after the fledging of any young. The critical period will usually fall between March 1 and August 15.

Secondary
The purpose of this zone is to further minimize disturbance.

The size of the secondary zone will be determined by local topography and resulting visibility from the nest. It shall lie outside the primary zone and be approximately circular with a minimum boundary of 40 chains from the nest.

Human activities into the secondary zone should be restricted during the critical period.

Roosting
Within 1/2 mile (40 chains) of existing nests, save three to five old growth trees for potential roost and perch trees during the breeding season.
Hawks and Owls, except Prairie Falcons
Nesting

Nesting areas are divided into primary and secondary zones.

**Primary**

The boundary of the primary zone should not be less than five chains. The management objective for this zone will be to maintain the present habitat characteristics.

The critical period, during which human activities should be restricted, will usually fall between March 1 and August 1.

**Secondary**

The boundary of the secondary zone should be an additional five chains radius beyond the primary zone (total 10 chain radius). In this secondary zone, modified treatments will be required. "Modified" means intermediate between that required in the primary zone, and that normally prescribed outside of the whole protection zone.

The critical period is the same as for primary zone 'Hawks' above.

Prairie Falcons
Nesting

Nesting areas are divided into primary and secondary zones.

**Primary**

Size: same as for primary zone Hawks.

Critical period: same as for primary zone Hawks.

**Secondary**

The boundary of this zone should be an additional 15 chains beyond the primary zone. The management direction for this zone will be a modified treatment between the primary zone, and full treatment beyond the secondary zone.

Critical period: same as for primary zone Hawks

Species Associated with Dead and Downed Logs

Down dead log requirements for wildlife are expected to be met through attrition of standing snags as they fall. Removal of these logs will not be allowed for other purposes. Wherever possible, two uncharred logs per acre should be left for wildlife habitat. These logs should be at least 12 inches in diameter or greater, and at least 20 feet in length.

Species Associated with Various Plant Communities and Successional Stages

Diversity is to be provided for by maintaining representative portions of all plant associations and having various successional stages represented in an area through time.
Species Associated with Springs, Bogs and other Unique Habitat
Seeps, springs, bogs, wet areas, and any other unique habitats, often or generally less than 10 acres in size, will be identified and evaluated on a project level basis and given appropriate protection.

Introduced Species
Evaluate proposals for introducing wildlife (case-by-case) through the National Environmental Policy Act (NEPA) process.

Management Area Standards and Guidelines
Resource - Wildlife and Fish

Practice
Habitat Management

Standard and Guideline
General
Manipulation of habitat to sustain the value of wilderness or to perpetuate a threatened or endangered wildlife species may be allowed with approval of the Chief of the Forest Service.

Applicable Management Area
MA-F1 Black Canyon Wilderness
MA-F2 Bridge Creek Wilderness
MA-F3 Mill Creek Wilderness
MA-F4 North Fork Crooked River Wilderness Study Area

Standard and Guideline
Manipulation of habitat will be allowed only for research purposes, with consent of the PNW Station Director.

Applicable Management Area
MA-F5 Research Natural Areas

Standard and Guideline
Project activities for habitat management are restricted from December 1 to May 1. If exceptions are necessary, they will require informal or formal consultation with the U.S. Fish and Wildlife Service.

Applicable Management Area
MA-F12 Eagle Roosting Areas
Wildlife and Fish

Standard and Guideline
Project activities for habitat management are restricted to open roads and adjacent areas from December 1 to May 1.

Applicable Management Area
MA-F18 Hammer Creek Wildlife Recreation Area
MA-F20 Winter Range
MA-F21 General Forest Winter Range

Standard and Guideline
Pileated Woodpecker Habitat
(As Management Indicator)
For every 12,000 to 13,000 acres, provide one habitat area of 600 acres per mating pair. Each habitat area consists of a reproductive area and a feeding area. Both should be within a 1,000 acre unit.

Reproductive areas should be maintained in contiguous 300 acre blocks where possible. If not possible, habitat may be arranged in blocks no less than 50 acres and no more than 1/4 mile apart. Maintain a minimum average of two hard snags per acre, greater than or equal to 12 inches DBH. Forty five of these 600 snags should be greater than or equal to 20 inches DBH.

Feeding areas should also be maintained in 300 acre blocks and adjacent to reproductive areas, where possible. Feeding areas should be no further than one half mile from reproductive areas. Maintain a minimum average of two hard snags per acre, greater than or equal to 10 inches DBH for feeding (approximately 90 percent snag level).

Vegetative management (except prescribed livestock use) will not be allowed, until further research is available on the needs of the dependent species.

Applicable Management Area
MA-F6 Old Growth

Standard and Guideline
Connective Habitat
Suitable connective habitat between old growth stands for pileated woodpeckers, will be provided to some degree by riparian areas, and other restricted management areas on the Forest. Specific management for this habitat has been provided for through approximately 41 miles of priority riparian corridors on the Forest. In these areas, the “protection zone” has been increased from 100 feet to 200 feet wide, to provide security for travelling woodpeckers. Riparian management emphasis and desired future condition will apply to connective habitat.
Applicable Management Area
MA-F15 Riparian

with additional protection in the following stream courses:
Trout Creek
Bear Creek
Drake Creek
Pine Creek
Allen Creek
Indian Creek
West Fork Bridge Creek
Porter Creek
Howard Creek
Fox Creek (Pisgah)
Cottonwood Creek
Baldy, Little Windy and Windy Creeks
Nicoll Creek

Standard and Guideline
Provide habitat for wintering bald eagles, which at a minimum includes at least one 36 to 40 inch DBH tree for roosting. Consult with U.S. Fish and Wildlife Service when conflicts between project activities and habitat needs cannot be resolved, or uncertainty exists. A certified Silviculturist will model tree stand conditions to meet large tree objectives, and prepare a prescription for implementation, subject to U.S. Fish and Wildlife Service review and approval.

Applicable Management Area
MA-F12 Eagle Roosting Areas

Standard and Guideline
Big Game Habitat

Manage to provide high quality habitat for elk and deer.

Management objectives are based on achieving habitat effectiveness over time. Quantity and quality of cover, and open road density are the main factors influencing the Habitat Effectiveness Index (HEI), and should be designed in concert to achieve the desired HEI shown. Habitat manipulation (including timber sale projects) should be designed to achieve both the short term and long term values for HEI shown below. Preference is to plan for long term values, as current habitat is usually limited by existing cover.
Cover types may include mountain mahogany and conifer species, as well as that provided by other management areas within the project area, i.e., old growth, riparian, etc.

Preference for cover is mixed conifer.

Minimum crown closure for cover is 40 percent. Up to 50 percent of the total pine acres may remain in a moderate to high susceptibility to bark beetle attack in order to meet cover needs.

It is recognized that MA-F18 (Hammer Creek) has a somewhat higher HEI due to existing conditions, including cover, therefore the HEI objective may be higher than those shown in Table 4-36.

Table 4-36 shows a detailed breakdown of the HEI components for MA-F18 and MA-F20. It should be noted that the values displayed are “weighted averages.” It is expected that individual projects will be above and below these values, but that the overall objective for the management areas will be met.

When a project planning area has an inherent low potential for production of cover, size of desired cover patches should vary, based on the ratio of cover within the area as follows:

<table>
<thead>
<tr>
<th>Percent of Area in Cover</th>
<th>Cover Patch Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>40% and over</td>
<td>30-60 acres</td>

1/ Following is an example of how this percent should be used

**PROJECT AREA**
- Total Acres: 10,000
- Total Forested Acres: 5,000
- Pine Acres: 70%
- MC Acres: 30%

**EXAMPLE  Acres of Cover**
- Pine 7% (from Table) \times [70\% \times 10,000] = 7\% \times 7,000 acres
- MC 23% (from Table) \times [30\% \times 10,000] = 23\% \times 3,000 acres

2/ One mile of open road per section is a management objective from December 1 to May 1, three miles per section the remainder of the year. These are the averages based on management area-wide conditions and may be adjusted up or down to meet HEI goals and objectives.
Applicable Management Area
MA-F18 Hammer Creek Wildlife/Recreation Area
MA-F20 Winter Range

Standard and Guideline
Manage to provide habitat for big game, while meeting the primary emphasis for the specific management area (see Management Area Prescriptions, Section 2).

Management objectives are based on achieving habitat effectiveness over time. Quantity and quality of cover, and open road density are the main factors influencing the habitat effectiveness index (HEI), and should be designed in concert to achieve the desired HEI shown. Habitat manipulation (including timber sale projects) should be designed to achieve both the short term and long term values for HEI shown below. \[^]{See Forest-wide Standards and Guidelines for explanation of HEI. Procedures for calculating HEI are available at the Ochoco National Forest Supervisors Office.}

Cover types may include mountain mahogany and conifer species, as well as that provided by other management areas within the project area, i.e. old growth, riparian, etc.

Preference for cover is mixed conifer.

Minimum cover is defined as that having 40 percent crown closure on greater than 40 foot tall trees. Pine stands will generally remain in low susceptibility to bark beetle attack.

In the early decades, habitat effectiveness is limited by the lack of cover in existing stands. Strive for higher HEI where biologically feasible, within the bounds of the management area emphasis.

Table 4-37 shows a detailed breakdown of the HEI components for MA-F21. It should be noted that the values displayed are “weighted averages.” It is expected that individual projects will be above and below these values, but that the overall objective for the management areas will be met.

- Pine: 9% (from Table) x [70% x 10,000] = 9% x 7,000 acres
- MC: 39% (from Table) x [30% x 10,000] = 39% x 3,000 acres
Size of cover patches will be based on Forest-wide standards and guidelines for “Timber,” and management objectives for the management area.

**Applicable Management Area**
MA-F22 General Forest

---

**Standard and Guideline**
Manage to provide habitat for big game, while meeting the primary emphasis for the specific management area. There is no cover objective or minimum cover requirement for these areas. Cover will be incidentally provided through implementation of management prescriptions. Road objectives are based on management area emphasis and are stated under Management Area Standards and Guidelines - Transportation System. Also see Management Area Prescriptions, Section 2, for management area emphasis.

**Applicable Management Area**
MA-F6 Old Growth
MA-F7 Summit National Historic Trail
MA-F8 Rock Creek/Cottonwood Area
MA-F9 Rock Creek/Cottonwood Creek Unroaded Helicopter Area
MA-F10 Silver Creek Area
MA-F11 Lookout Mountain Recreation Area
MA-F12 Eagle Roosting Areas
MA-F13 Developed Recreation
MA-F14 Dispersed Recreation
MA-F15 Riparian
MA-F16 Bandit Springs Recreation Area
MA-F17 Stein's Pillar Recreation Area
MA-F19 Deep Creek Recreation Area
MA-F23 North Fork Crooked River Recreation Corridor
MA-F24 North Fork Crooked River Scenic Corridor
MA-F25 Highway 26 Visual Corridor
MA-F26 Visual Management Corridors
MA-F27 Round Mountain National Recreation Trail
MA-F28 Facilities

---

**Standard and Guideline**
Give preferential treatment to land and vegetation for a 300 foot radius surrounding elk wallows and calving areas.

**Applicable Management Area**
MA-F11 Lookout Mountain Recreation Area
Wildlife and Fish

Standard and Guideline
Grass seeding is recommended on acres disturbed by timber harvesting or other activities which are not treated with normal erosion seeding. Exceptions will occur when grass seeding would seriously interfere with reforestation efforts or other management objectives. Recommended is two pounds per acre of orchard grass. Fall green-up after the regularly scheduled grazing season will be reserved for big game.

Applicable Management Area
MA-F11 Lookout Mountain Recreation Area
MA-F17 Stein's Pillar Recreation Area
MA-F12 Hammer Creek Wildlife/Recreation Area
MA-F20 Winter Range
MA-F21 General Forest Winter Range

Standard and Guideline
Cavity Nester Habitat
Strive to provide snag habitat at the levels shown, while meeting the primary management emphasis for the specific area. The 40 percent level is the lowest level for any management area, except where safety is involved (MA-F's 13, 14 & 28). See Table 4-39 for applicable management areas.

Snags may be provided through either identifiable snag patches, or evenly distributed. Snag patches (clumping) is the preferred method in most cases. See Forest-wide Standards and Guidelines for Wildlife and Fish, Section 3 of this chapter for direction on selection of best method.

Snag Patch Method (Clumping)
When using the snag patch method, the acreage and number of the untreated clumps or units will vary according to timber type and acres treated. These areas may be managed on a double rotation, and made available for harvest in the future when adjacent and previously harvested areas are suitable for snag habitat production.

Snag patches should be distributed as evenly as possible, and located (on the average) one per 10 acres. This is necessary to meet the smallest territory size needs of a pair of excavator species.

Permanence of snag patches is more effectively achieved when size of snag patches exceeds one acre. But, it may be necessary to designate patches less than one acre in size in order to meet the territory needs stated above, which is the more important habitat need.

Table 4-40 shows size of areas needed to be left for a double rotation based on major species groups and snag level. Areas selected for double rotation should be fully stocked and have a variety of size and tree conditions. In two-story pine types, full stocking may very often not occur. When this is encountered, use the Individual Snag Distribution Method instead.

**Individual Snag Distribution Method**

Table 4-41 shows the number of large green trees to leave per acre when using the individual snag distribution method. This will ensure a supply of large snags and part of the smaller snags (10-20").

</table>

1/ Assumes 100 years before large snags will be produced

2/ Assumes 120 years before large snags will be produced

**Clump and Individual Tree Methods**

The size of residual stocking and adjacent stand conditions need to be considered to ensure a supply of small snags. If there is a predicted shortage of small snags, then additional trees in the 10 inch plus size class should be left within the managed stand to meet this need.
Practice
Species Management

**Standard and Guideline**
Native animal species will be maintained. Allow no intentional introduction of non-native wildlife species.

**Applicable Management Area**
- MA-F1 Black Canyon Wilderness
- MA-F2 Bridge Creek Wilderness
- MA-F3 Mill Creek Wilderness
- MA-F4 North Fork Crooked River Wilderness Study Area
- MA-F5 Research Natural Areas

**NOTE** The Forest-wide standards and guidelines for Air Quality, Biological Diversity, Old Growth, and Social and Economic resources apply to all management areas as appropriate with no management area standards and guidelines. This table will assist the reader in locating the applicable standards and guidelines for each management area by referencing the applicable pages (only the page number suffix is listed, all are preceded by a 4.)
Chapter 5

Implementation of the Forest Plan
Chapter 5

Implementation

Introduction

This chapter explains how management of the Ochoco National Forest will move from the current direction and situation into Alternative I. Implementation can be influenced by previous management activities and objectives, project analysis, budget, monitoring and evaluation, and when necessary, the required amendment process.

Implementation will require a transition from an existing management program with a "pre-allocated" budget and accomplishment targets to a new management program, represented by Alternative I, with budget, goals, and objectives based on identified issues and concerns. The Plan establishes the management direction for the Ochoco National Forest for the next 10 to 15 years. In doing so, it conforms to existing laws, regulations, and policies, including those found in the Forest Service Manual and Handbooks, and the Regional Guide.

Project Scheduling

An initial schedule of proposed projects is contained in the appendices of this document. These activities represent possible projects and time frames from which annual work programs (dependent on approved funding) are developed. The listing of projects and schedules for a ten-year period are maintained by unit managers. Listings will routinely change as projects are implemented or are removed from the lists for other reasons, and as new projects take their place. Projects are implemented in response to public demand, planned outputs and the annual budgeting process.

Budget Proposals

Multiyear budget proposals that identify funding needed to implement the scheduled outputs will be developed. Upon approval of a final budget for the Forest, the annual program of work is finalized and carried out. The annual program is an incremental implementation of the management direction in this Plan. Outputs and activities in individual years may vary from those shown in the Management Objectives (Chapter 4, Section 1) and schedules (Appendix A), depending on actual budget, but will progress toward the desired future condition.

The rate of progress is dependent to a large extent upon funding to support activities needed to achieve plan objectives. Table 5-1 compares the projected funding level that will be required to implement Alternative I to funding levels received by the Ochoco National Forest from 1985 to 1989.

Environmental Analysis

Projects and activities are subject to analysis under the National Environmental Policy Act (NEPA) process before they can be implemented. Depending on expected environmental consequences, a categorical exclusion, environmental assessment, or environmental impact statement may be prepared. All documents, including categorical exclusions, will be available for public review.

Monitoring and Evaluation

Monitoring is the means of measuring and evaluating the effectiveness of the Forest Plan implementation. Monitoring provides quantitative and qualitative information on the progress and results. It is a

1/ Implementation will begin in Fiscal Year 1990. The Program Budget for Fiscal Year 1992 scheduled for completion in late 1989 will be the first to reflect the final plan. Budget levels requested during the draft planning period will be amended to support our final document.

3/ Other is a composite of Recreation, Wildlife, Water, etc.

Accounting system did not identify detail until FY98.
Implementation

means to determine how well assumptions used in preparing the Plan reflect actual conditions, how well objectives of the Plan are being met, and the appropriateness of the management standards and guidelines. Monitoring may lead to changes in management practices, or provide a basis for minor adjustments, amendment, or possible revision of the Plan.

Monitoring is intended to help keep the Forest Plan dynamic and responsive to changes. When a situation is identified as being outside the limits of acceptable variability, appropriate amendment, revision, or other changes may be made. Monitoring and evaluation have a distinctly different purpose and scope. Monitoring consists of gathering data, observations, and information. During evaluation, the data and information are analyzed and interpreted. This process provides information necessary to determine if planned conditions or results are being attained and are within the intent of the Plan, and if not, why.

It will provide information to help determine, for example:

- whether laws, regulations, and policies are being followed, including those found in the Regional Guide, Plan standards and guidelines, and the Forest Service Manual and Handbooks;
- whether the Forest Plan responsively addresses the issues, concerns, and opportunities in a publically acceptable manner;
- whether management prescriptions are producing the predicted or desired environmental results,
- if costs of implementing the Plan are within projected limits;
- if projected outputs are being produced;
- whether there are new issues and concerns not adequately addressed by the Plan.

There are a number of monitoring systems currently in place to comply with administrative and legal responsibilities. Examples include MAR, PAMARS, RAMIS, TSPIRS, STARS, NIRP, etc. Additional examples may be found in Forest Service Handbook 1309.14 Forms and Reports.

Forest Plan monitoring does not replace or substitute these systems, but rather complements them by addressing specific issues and concerns identified through the planning process and providing additional information for evaluating the effectiveness of the Plan.

Table 5-3 outlines monitoring actions, including a number of ongoing monitoring items that will help evaluate how implementation is progressing. Following the process matrix in Figure 5-1, evaluation of the monitoring data will lead to decisions of the following types:

1. Continue practice, no change necessary.
2. Refer the problem to the appropriate Forest officer for corrective action.
3. Modify the management practice through Plan amendments.
5. Revise output schedules.
6. Revise unit output costs.
7. Revise the Plan

The first step in monitoring will be comparing the Plan to the annual budget received by the Forest. This will include a review of Forest capabilities to implement the prescriptions in the Plan, cost comparisons and output levels. Variances beyond a threshold of 10 percent will be presented to the Ochoco National Forest Management Team for decision. Resolution may be accomplished through allocation adjustments, requests for change to the Regional Office or other adjustments or amendments. Figure 5-2 shows schematically how the process proceeds.

Amendment and Revision Process

The Forest Plan incorporates legal mandates, professional judgement and the public's stated concerns into a future vision of the Forest. It charts a path for getting there by developing management goals and
objectives and translating them into management direction in the form of standards and guidelines for management areas on the Forest. National Forest planning is a dynamic process, and the products -- Forest Plans -- are similarly dynamic. Forest Plans can and should be modified if conditions warrant. As management goals are applied on the ground or as new information is learned about resources, the Plan's goals and objectives, or activities the goals generate, may no longer be appropriate. In such instances, activities may be tailored to fit the resource, or planning objectives as stated in the Plan may be amended. Plans do not apply direction in site-specific management activities. It would be unrealistic and wrong to try to identify, analyze and schedule the myriad projects or activities that occur on a National Forest. Instead, this type of site-specific planning occurs at the project-level planning stage, such as allotment management planning.

This Forest Plan may be changed either by an amendment or a revision. Such changes may come about as a result of the monitoring process or project analysis (Figure 5-2). An amendment may become necessary as a result of different situations. They can include:

- recommendations of the Interdisciplinary Team based on their review of monitoring results;
- the determination that an existing or proposed permit, contract, cooperative agreement, or other instrument authorizing occupancy and use is not consistent with the Forest Plan, but should be approved, based on project level analysis,
- changes in proposed implementation schedules needed to reflect differences between funding levels assumed in the plan and funds actually appropriated;
- changes necessitated by resolution of administrative appeals,
- changes to correct planning errors;
- changes made necessary by altered physical, social, or economic conditions.

Based on an analysis of the objectives, guidelines, and other aspects of the Forest Plan, the Forest Supervisor shall determine whether a proposed amendment would result in a significant change to
the Plan. If the change is determined to be significant, the Forest Supervisor shall follow the same procedure as that required for development and approval of a plan. If the change is determined not to be significant, the Forest Supervisor may implement the amendment after appropriate public notice and compliance with NEPA (see Figure 5-3).

The Regional Forester will approve significant amendments, and the Forest Supervisor will approve "not significant" amendments. The determination of significance will be documented in a decision notice and would be appealable under 36 CFR 217.

With respect to revision, the NFMA requires revision of the Forest Plan at least every 15 years. However, it may be revised sooner if physical conditions or demands on the land and resources have changed sufficiently to affect overall goals or uses for the entire Forest. If a revision becomes necessary, the procedures described in 36 CFR 219.12 will be followed. The Chief, however, must approve the scheduling of such revision.

Consistency with Other Instruments

This Forest Plan serves as the single land management plan for the Ochoco National Forest. All other land and resource management plans are replaced by the direction in this Plan; a list of plans revised, superseded, or updated by this Plan are shown in Table 5-2.
All outstanding and future permits, contracts, cooperative agreements and other instruments for occupancy and use of lands will comply with direction in the Forest Plan as soon as practicable, subject to the valid existing rights of the parties involved. This will occur generally within three years of the date of implementation of this Plan.

**Recreation**

All leases and Memoranda of Understanding between the Ochoco N.F. and the State of Oregon, Bureau of Reclamation, or other agencies, will be consistent with Forest Plan direction at the first reissuance of said leases and Memoranda following plan implementation.

**Wildlife and Fish**

Within two years after implementation, habitat survey schedules and habitat improvement project schedules will be prepared for a five-year period.

**Range**

Existing Allotment Management Plans and Grazing Permits will be in compliance with Forest Plan direction on the first update or reissuance following Plan implementation.

In implementing the Forest Plan, any necessary adjustments between existing permitted livestock numbers and plan direction will be made by evaluating management direction for allotments, and determining if a change in management intensity for the allotment is necessary. Factors influencing this decision will include: permit status, condition of improvements, funds available, priority needs on other allotments, and ability to meet standards and guidelines in this Plan.

**Timber**

The schedule of timber sale offerings in Appendix A10-2 of the Plan will be updated at least annually. Timber sales offered, and stand management contracts issued, after implementation of the Forest Plan will comply with direction contained in the Plan. Changes to existing contracts, including timber sales and other stand management projects, may be considered on a case-by-case basis where overriding resource considerations are present. Otherwise, all existing contracts will be administered in accordance with original provisions.

Timber implementation plans, such as the Forest Tree Improvement Plan, Seed Orchard Management Plan, and Tree Seed Inventory Plan, will be brought into compliance with the direction contained in the Forest Plan within two years of Plan implementation.

**Lands**

All development and management plans for facilities will be consistent with Forest Plan direction as soon as practicable, subject to valid existing rights of outstanding permits, contracts, and cooperative agreements.

**Minerals**

New mineral leases, permits, contracts, and operating plans will be evaluated for consistency with the Forest Plan as they are received or proposed. Existing permits and operating plans will be reviewed for consistency with Forest Plan standards and guidelines. Modifications of these permits will be required only when authorized by law or regulation. Operating plans may be modified on a case-by-case basis if overriding resource considerations are present.

Since the Forest Service has no authority to modify stipulations attached to existing mineral leases, modification will be recommended to the proper agency when found necessary.

**MONITORING PLAN NOTES**

This monitoring plan is intended to be a dynamic plan subject to revision as the Forest and Grassland Plans are implemented. The process to update and, or amend the plans is iterated in figure 5-2, p ___.

**Definitions of monitoring plan elements**

- **Monitoring Item** - Primary resource or activity to be monitored
- **Action or Effect to be Monitored** - A specific statement of what will be checked
- **Units of Measure** - A quantifiable amount related to the action or effect.
- **Variability Threshold** - Levels which, if exceeded, may trigger the need for re-evaluation of the Forest Plan
- **Data Precision** - How exact or accurate the measurement, rated high, moderate or low (H, M, L)
- **Reliability** - Expected probability that information acquired through sampling will reflect actual conditions. Rated high, moderate or low (H, M, L)
- **Suggested Methods** - Statement of how monitoring will be accomplished
- **Who Will Monitor** - Identifies Program Manager in charge of implementation of monitoring, data collection, analysis, evaluation, and report preparations
- **Monitoring Frequency** - The scheduling of sampling for the item to be monitored stated in years or parts of years
- **Data Location** - Indicates where the collected monitoring data, analyses and evaluation reports for the item monitored are accumulated
- **Estimated Annual Cost** - This cost includes existing and planned monitoring items

**FOOTNOTES**

1/ GIS - Graphic Information System. The monitoring plan recognizes that when GIS is implemented on the Forest and Grassland, it will provide the base data upon which monitoring will rely. In the interim, the existing data bases will be used.

2/ Bucket or secour sampling using techniques outlined by Munther and Liburn (Aquatic Environment and Fisheries Habitat, 1986 Monitoring Report, 1987 Bitterroot, Deerlodge, and Lolo NF)

4/ Utilization levels will be incorporated into allotment management plans

5/ Recreation Opportunity Spectrum

6/ EHA model - Equivalent harvest acres model tracks harvest by watershed and provides a risk assessment of unacceptable hydrologic activity resultant of management practices such as timber harvest and road development.

7/ Timber resource inventory

8/ TRACS

9/ Habitat effectiveness index - The HEI model, using cover, forage relationships, vegetation trends and road density, measures habitat capability for big game at a point in time. The HEI provides trend information over time to determine whether habitat capability objectives are being met.

These totals represent Section 106 clearance of proposed timber sale activities as per Forest's "Interim Cultural Resource Inventory Design." Monies for protection, mitigation, and enhancement are not included.

1/ Cost of inventory varies between an estimated $2.00 to $2.15 per acre cleared.

2/ M acres represents project area cleared by field inventory, usually 3 times larger than actual sale area, as per Forest's "Interim Cultural Resource Inventory Design."

APPENDIX A10

TIMBER SALE ACTIVITY SCHEDULE

INTRODUCTION

This appendix displays how the timber outputs, as projected by the preferred alternative in the FEIS, are likely to be provided during the period from 1990 through 1994, and projected harvest by management area for the next two decades.

The following tables list the planned timber sales information and conditions current at the time of Forest Plan development. If these conditions change, and as new information becomes available during implementation of the Forest Plan, the timber sale schedule may be modified.

The "small sales" (usually less than 2.0 million board feet) may change on very short notice to meet special product demands or to take advantage of salvage opportunities or for disease or insect prevention. The small sales program is used to achieve a variety of special purposes such as the salvage of blow-down timber or to remove hazard trees from developed campgrounds. A variety of silvicultural methods may be used depending upon the objective of the individual small sale.

Table A10-2 is derived from the Timber Sale Action Program for the Forest. Maps showing the sale areas are available for inspection at the Forest Supervisor's Office and indicated Ranger Districts.

  - S = Suspected to be present
Appendix D

Travel Plan

Appendix E

Spill Incident Response Plan
Appendix D

Travel Plan

Process

Various laws, regulations, and Executive Orders recognize on-road and off-road uses as legitimate activities on national grasslands and forests.

The Transportation Planning Handbook, FSH7709.55 contains procedural direction on access and travel management. The objective in the handbook states, "...identify and document recreational opportunities by integrating off-road travel management with on-road management, under the common framework of access management."

The direction under FSM 2355, which sets objectives for recreation, states, "...provide off-road vehicle recreation opportunities that are in concert with the environmental setting, minimize off-road vehicle effects on the land and resources, promote public safety, and control conflicts with other uses of the National Forest System lands."

The regulation 36 CFR 219.21(d), requires that we consider the impacts of proposed recreation activities on other uses and values and the impacts of other uses and activities associated with them on recreation opportunities, activities, and quality of experience. Off-road vehicle use is specifically addressed by 36 CFR 219.21(g):

Off-road vehicle use shall be planned and implemented to protect land and other resources, promote public safety, and minimize conflicts with other uses of the National Forest System lands. Forest planning shall evaluate the potential effects of vehicle use off roads and, on the basis of the requirements of 36 CFR 295 of this chapter, classify areas and trails of National Forest System lands as to whether or not off-road vehicle use may be permitted.

Executive Order No. 11644, as amended by Executive Order 11989, directs that the designation of off-road vehicle areas shall be based upon minimizing damage to soils, watersheds, vegetation, and other resources, and minimizing conflicts with other uses. The travel map development, which consists of describing how users access the Ochoco National Forest and Crooked River National Grassland, is consistent with this direction. It includes all forms of travel, including on-road and off-road.

Traffic management (on-road) and off-road vehicle standard and guidelines for all management areas were determined through an integrated interdisciplinary team approach and are found in the prescriptions in Chapter 4 for the Forest and the Grassland Plans.

Implementation

The following is representative of the action items or activities which will be scheduled and completed through implementation of the Forest and Grassland Plans:

Enforcement

Orders will be issued by the Forest Supervisor in accordance with 36 CFR 261.50. A copy of the order imposing prohibitions will be placed in the offices of the Forest Supervisor and district rangers.

The closures and restrictions (controls) covered under Title 36 CFR 261, Subpart B are applicable and are supplemental to those in 36 CFR 261, Subpart A.

Traffic and Off-Road Management

Uniform traffic management direction will be developed for road design standards, road maintenance plans, traffic control devices (to include signing), closure orders, and trail design standards.

Revise the Forest and the Grassland sign plans to bring them in line with the Plans.

From the appropriate management area direction
and standard and guidelines, apply appropriate entrance information that communicates to the Forest and Grassland visitor the current conditions and purpose intended by management.

Establish priorities by management areas to insure consistent and timely application of the travel access management decisions.

Establish travel management needs during each phase of the program development and budget (PD&B) process, identifying those needs and direction specific to the situation.

Explore the potential for using the Forest and Grassland development road system to provide off-road travel opportunities. Roads temporarily closed to vehicular traffic could be used to supplement off-road vehicle opportunities.

**Education and Involvement**

Endorse organization of various motorcycle clubs and off-road enthusiasts to help implement this plan. This coalition could help develop, monitor, and maintain existing and new trail systems, which could minimize Forest Service cost through the use of volunteer work and partnership projects.

Initiate a program to educate employees in the technical linkage between the Plans, transportation planning, resource objectives, and travel management.

Implement the monitoring program to keep management appraised of changing needs so that methods, techniques, facilities, and settings can be managed appropriately.

**Revisions**

The Forest and Grassland will move towards controlling off-road vehicle use in order to minimize impacts to resources and other user groups while not necessarily restricting off-road users. The use of closed road systems, and the designation of trails and destinations, will be encouraged for those management areas without existing off-road restrictions, such as General Forest and General Forage.

Additional off-road vehicle recreation opportunity proposals will be in accordance with management area direction and standards and guidelines. All projects and activities are subject to analysis under the National Environmental Policy Act (NEPA) process before they can be implemented.

The travel map will be updated annually or as necessary to reflect these changes as well other changing conditions or new information, such as changes to the traffic management of open on-road use under the Green Dot program. If these or other situations are identified as being outside the limits of acceptable variability, appropriate amendments or other changes may be made. The amendment process, as well as monitoring and evaluation, can be found in Chapter 5 of the Forest and Grassland Plans.

The successful implementation of new off-road vehicle trails, or other changes, will be dependent upon a policy that insures that these opportunities are met through an integrated, interdisciplinary, and public approach, and that they adhere to the requirements of the Forest and Grassland Plans.
Appendix E

Spill Incident Response Plan

The Forest Spill Incident Plan establishes reporting and response procedures to be followed in the event of an accidental spill of toxic, hazardous or otherwise dangerous materials, including petroleum products.

Because of the serious health and water pollution potential of many of the materials used with our varied land management activities and transported across our land, spills will be given the same emergency priority as a forest fire.

The Plan relies on the expertise of the local, state and federal agencies, and private contractors for spill containment and cleanup. The Forest Service's role in a spill incident is communication and coordination. The key Forest players in a spill response are Dispatch and the Forest spill coordinator. They may request others to assist them, depending on the nature of the spill.

Health and Safety

Of paramount importance is the health and safety of personnel at the spill site, and of downstream water users if supplies are contaminated.

When approaching any spill site, the following precautions must be taken.

- Approach from the upwind direction if possible,
- Keep all unauthorized people away from the spill site,
- Avoid inhaling fumes, smoke, vapors and dust even if no hazardous materials are involved, and
- Do not assume that gases or vapors are harmless because of lack of smell.

Identify the spilled material from a distance as soon as possible. Until the material is identified, avoid all contact including breathing fumes.

Remember that the Spill Plan is written for professionals trained and equipped for emergency responses. The people at the spill site are probably not such professionals, and should not be encouraged to exceed their abilities.

Priority should be given to notifying downstream water users, especially those with domestic, fish hatchery, and irrigation supplies.

Responsibility

The party responsible for the spill should be identified as soon as possible. This party is responsible for containment and cleanup of the spill and is liable for any damages that might occur. The party is also responsible for reporting spill incidents involving toxic, hazardous or otherwise dangerous materials to the appropriate state and federal agencies. The Forest Service will also notify local, state and federal agencies of such spills to ensure that the proper agencies are promptly notified.

Spill Containment

Upon evaluating a spill incident (identification of the material, health and safety problems, and quantity), action will be taken as soon as possible to contain the material at the immediate spill site. This
is especially important if there is a potential for contaminating nearby streams, lakes, or wetlands and downstream water supplies.

Exceptions to taking any immediate containment action would be when the spill material is extremely hazardous and is beyond the ability of the agency and local contractors to handle or it cannot be adequately identified.

Spill Cleanup

All spills involving toxic or hazardous materials or other substances which could contaminate nearby streams, lakes, wetlands or downstream water supplies will be cleaned up as soon as possible.

Spills involving toxic or hazardous materials should be evaluated for having the cleanup and disposal work performed by companies that specialize in this type of work.

Responsibilities of Forest Personnel

Reporting Person

Avoid contact with spilled material.

Call Dispatch for help

Identify yourself, tell how you can be contacted, location of spill, identity & quantity of spilled material

Isolate the spill area.

Wait for additional instructions.

Dispatch

Obtain information from Reporter to fill out Spill Incident Report (See Figure E-1).

Notify Forest Spill Coordinator or the Forest Alternate Spill Coordinator.

If no one can be reached in 1 & 2 above, call OARS and follow their instructions (see Notification List).

Forest Spill Coordinator

Notify and coordinate with the appropriate local, state and federal agencies for spill scene security, containment, and cleanup.

Assure the health and safety of Forest personnel and the Public.

Inform the Forest Supervisor, District Ranger and appropriate Forest staff of spill incident status.

Notify downstream water users of spills if there is a potential for contamination of domestic, or irrigation water supplies.

Prepare initial and final spill response reports for each incident.

Notify the Regional Office of spill.

Provide Forest leadership in Spill Response planning.

Memorandum of Understanding between the U.S. Department of Agriculture, Forest Service and the Oregon Department of Environmental Quality

December 1, 1978

This document can be found at the Ochoco National Forest Supervisor’s Office, in Forest Service Manual 1561-5 - Water Department (Irrigation and Flood Control). Exhibit 1.

The Memorandum of Understanding between the Oregon Department of Environmental Quality (DEQ) and the U.S. Department of Agriculture, Forest Service (USFS), delineates the responsibilities and activities to be performed by each agency pursuant to the implementation of the Oregon Statewide Water Quality Management Plan on lands administered by the USFS.

The Statewide Water Quality Management Plan has been developed to meet the requirements of state law, federal law, the Federal Water Pollution Control Act, and the Clean Water Act.

The DEQ’s overriding purpose is to control pollution. The Forest Service’s job is to manage public national forest lands. Under the memorandum of understanding, USFS and DEQ mutually agree to specified provisions in order to prevent duplication of effort and provide the coordination necessary to meet the implementation requirements of the Clean Water Act.

Specified provisions cover a range of areas, including: agency roles; implementation, coordination, and administration of the memorandum; and designations of control.

Appendix H
Wilderness Plans

Appendix I
Management of Wild Horses
The Ochoco National Forest has three wildernesses classified under the Oregon Wilderness Act of 1984. They are: Black Canyon - 13,400 acres, Bridge Creek - 5,400 acres, and Mill Creek - 17,400 acres (see management area map, Alternative 1, or Chapter 4 maps). Legal map boundaries for the wildernesses are on file at the Forest and District headquarters responsible for administration of the area. The purpose of the plans is to:

- identify the unique characteristics of the wildernesses;
- identify concerns and issues related to the wildernesses and their management;
- establish management objectives;
- guide the allocation of the wildernesses into different opportunity, wilderness resource spectrum, (WRS) classes, and
- establish standards and guidelines and area-specific management direction.

**Legislative and Regulatory Requirements**

The management direction for wildernesses focuses on delivery and preservation of those wilderness-related benefits specified in the Wilderness Act of 1964, the National Forest Management Act of 1976, and in the Department of Agriculture and Forest Service policy guidelines. Selected excerpts from these laws and management guidelines follow.

**A. Wilderness Act of 1964**

(P.L. 88-577)

"...shall be administered for the use and enjoyment of the American people in such a manner as will leave them unimpaired for future use and enjoyment as wilderness, and so as to provide for the protection of these areas, the preservation of their wilderness character..." (Section 2a) "...wilderness areas shall be devoted to the public purposes of recreational, scenic, scientific, educational, conservation, and historical use.” (Section 4b)
B. Department of Agriculture Regulations
(36 CFR 293)

"...In carrying out such purposes, National Forest Wilderness resources shall be managed to promote, perpetuate, and, where necessary, restore the wilderness character of the land and its specific values of solitude, physical and mental challenges, scientific study, inspiration, and primitive recreation. To that end: (a) Natural ecological succession will be allowed to operate freely to the extent feasible. (b) Wilderness will be made available for human use to the optimum extent consistent with the maintenance of primitive conditions. (c) In resolving conflicts in resource use, wilderness values will be dominant to the extent not limited by the Wilderness Act, subsequent establishing legislation, or the regulations in this part." (36 CFR 293.2)

C. National Forest Management Act of 1976
(P.L. 94-588)

"In developing, maintaining, and revising plans for units of the National Forest System pursuant to this section, the Secretary shall assure that such plans -- (1) provide for multiple use and sustained yield of the products and services obtained therefrom... and, in particular, include coordination of outdoor recreation, range, timber, watershed, wildlife and fish, and wilderness;...” (Section 6e)

D. Department of Agriculture Regulations
(36 CFR 219)

"...Provide for limiting and distributing visitor use of specific portions in accord with periodic estimates of the maximum levels of use that allow natural processes to operate fully and that do not impair the values for which wilderness areas were created...” (219.18(a))

E. Forest Service Manual
Chapter 2320 (4/86)

The manager, then, must face the paradox of wilderness as described by Congress, as seen or felt by those whose values vary, and the uses and activities permitted and prohibited in those areas by the Wilderness Act. They must solve the problem of use of the area while still keeping these parts of the natural world intact. They must:

"...Manage the wilderness resource to ensure its character and values are dominant and enduring. Its management must be consistent over time and between areas to ensure its present and future availability and enjoyment as wilderness. Manage wilderness to ensure that human influence does not impede the free play of natural forces or interfere with natural successions in the ecosystems and to ensure that each wilderness offers outstanding opportunities for solitude or a primitive and unconfined type of recreation. Manage wilderness as one resource rather than a series of separate resources.”
F. Forest Service Manual
Chapter 2320.2 - Objectives

“1. Maintain and perpetuate the... resource of wilderness as one of the multiple uses of National Forest System land.

2. Maintain wilderness in such a manner that ecosystems are relatively unaffected by human manipulation and influences so that plants and animals develop and respond to natural forces.

3. Minimize the impact of those kinds of uses and activities generally prohibited by the Wilderness Act, but specifically excepted by the Act or subsequent legislation.

4. Protect and perpetuate wilderness character and public values including, but not limited to, opportunities for scientific study, education, solitude, physical and mental challenge and stimulation, inspiration, and primitive recreation experiences.

5. Gather information and carry out research in a manner compatible with preserving the wilderness environment to increase understanding of wilderness ecology, wilderness uses, management opportunities, and visitor behavior.”

G. Forest Service Manual
Chapter 2320.3 - Policy

“1. Where there are alternatives among management decisions, wilderness values shall dominate over all other considerations except where limited by the Wilderness Act, subsequent legislation, or regulations.

2. Manage the use of other resources in wilderness in a manner compatible with wilderness resource management objectives.

3. In wilderness where the establishing legislation permits resource uses and activities that are nonconforming exceptions to the definition of wilderness as described in the Wilderness Act, manage these nonconforming uses and activities in such a manner as to minimize their effect on the wilderness resource.

4. Cease uses and activities and remove existing structures not essential to the administration, protection, or management of wilderness for wilderness purposes or not provided for in the establishing legislation.

5. Because wilderness does not exist as a vacuum, consider activities on both sides of wilderness boundaries during planning and articulate management goals and the blending of diverse resources in forest plans. Use the Recreation Opportunity Spectrum (ROS) (FSM 2310) as a tool to plan adjacent land management.

6. Manage each wilderness as a total unit and coordinate management direction when they cross other administrative boundaries.

7. Use interdisciplinary skills in planning for wilderness use and administration.
8. Gather necessary information and carry out research programs in a manner that is compatible with the preservation of the wilderness environment.

9. Whenever and wherever possible, acquire non-Federal lands located within wildernesses, as well as non-Federal lands within those areas recommended for inclusion in the system.

10. Inform wilderness visitors that they face inherent risks of adverse weather conditions, isolation, physical hazards, and lack of rapid communications, and that search and rescue may not be as rapid as expected in an urban setting, in publications and personal contacts.”

Wilderness Fire Management Policy
Due to the importance of fire as a natural force in shaping local ecosystems, the Forest Service Manual direction on management of fire in these wildernesses is important to consider. The following are excerpts from the pertinent sections.

Forest Service Manual
Chapter 2324.2 - Management of Fire

2324.21 - Objectives

“1. Permit lightning caused fires to play, as nearly as possible, their natural ecological role within wilderness.

2. Reduce, to an acceptable level, the risks and consequences of wildfire within wilderness or escaping from wilderness.”

2324.22 - Policy
Summarized: Natural ignitions may be allowed to burn under prescribed conditions or human ignition prescribed fire may be used when unacceptable risks exist to life and property within wilderness or to life, property, and resources outside of wilderness from use of natural ignition prescribed fire.

Until such time as management plans for prescribed fire use can be developed and approved for each wilderness, all ignitions will be considered wildfire and will continue to be suppressed using appropriate suppression strategies.

Land and Resources Management Plan Direction

Standards and guidelines for wilderness management are contained in FSM 2322.03 -- 6-25, R-6 Supp.81. The desired condition, and standards and guidelines specific to the Ochoco National Forest’s wilderness are given in Chapter 4 of the Forest Plan. The schedules and monitoring (Appendix A-13) are also part of the wilderness plans.
Black Canyon Wilderness

(MA-F1)

Description
Black Canyon Wilderness contains approximately 13,400 acres. Black Canyon Creek drains into the South Fork of the John Day River and falls from 6,000 feet to 2,800 feet in elevation. The Wilderness is characterized by steep sideslopes and numerous north-south ridges with rolling to flat benches on the edges. Wolf Mountain and Dry Corner are on the south side. Bearskull Mountain is on the north side.

The north facing slopes are covered with mixed conifers; the south facing slopes are predominantly ponderosa pine and juniper. Other tree species include, white-fir, Douglas-fir, western larch, lodgepole pine, alder and aspen. The mixed conifer forest type accounts for approximately half of the total forest acreage in the Wilderness.

Approximately fifty to sixty percent of the total timbered land within the Wilderness boundaries is considered to be in old growth condition.

The water produced by the watershed is used by livestock, wildlife, anadromous fish, and irrigation from the John Day River. Riparian condition class is provided in the Forest Plan, Section 3.

Management Situation

Access
Black Canyon was managed as a roadless area prior to wilderness classification. There are no improved roads in the wilderness area; there is a jeep trail that commences from the south side of Humphrey's camp on Forest Road 3800 in the SW 1/4, NW 1/4, of Section 16, T.14 S., R.25 E., and ends at Owl Creek. The upper end of the road has been closed but needs further work to be obliterated. There are approximately ten roads that dead end at the Wilderness, which have been closed at the boundary.

Cultural Resources
A cultural resource survey has been conducted in the Wilderness in the burned area east of the South Prong Canyon to the South Fork of the John Day River. There are some recorded pictographs in Black Canyon that will need protection if their location becomes well known. There have been no cultural surveys conducted in Black Canyon west of South Prong Canyon (there are no known sites in the area).

The only known structure in the Wilderness is a partially constructed log cabin on Owl Creek. Management direction is to eliminate this structure.
Fire
Black Canyon averages two to four fires a year with one large fire (500 acres or greater) every 10 years under current situations. Major fires in the Wilderness will be prone to escape the boundaries. There are heavy fuels in the west end and light flashy fuels in the east half. The steep ground is unsafe for firefighters.

There are remnants of a fire camp and firelines left from the Young's Butte Fire in the late 70's.

Forage
Permitted livestock use is outlined in Table 1.

Table 1

</tr>
</tbody>
</table>

The majority of Black Canyon Wilderness is within the Bearskull-Cottonwood Allotment, but the Wilderness also overlaps into the north end of Wind Creek and Dry Corner Allotments. Very little of the Wilderness is actually grazed by livestock because of the steep terrain and heavy timber. Sheep from the Bearskull-Cottonwood Allotment make some use of the fringes of the north and west sides of the Wilderness, but are not taken down into the canyon. Cattle from the Dry Corner Allotment use the area around Lost Indian Reservoir on the fringe of the Wilderness, and cattle from the Wind Creek Allotment similarly use the area around South Prong Reservoir, Crow Bar Spring, and South Prong Troughs. There are parts of the boundary that are fenced on the north ends of the Wind Creek and Dry Corner Allotments.

Historically, the canyon bottom has received some unauthorized use, primarily from cattle coming up the creek from the South Fork and off of private land from the Sunstrum place. Since the fence between the Sunstrum Place and Black Canyon Creek has been rebuilt, that access to unauthorized cattle has been fairly well eliminated. A drift fence on the lower end of the canyon will keep cattle from coming up the canyon from the South Fork if the gate is kept closed.
Forest Health

Insects and Disease - Western spruce budworm populations have been building for years, and are epidemic in some areas of the Wilderness, where damage from defoliation is extensive. The outbreak is primarily concentrated in the mixed conifer timber types; stands containing a heavy component of fir are most susceptible. The absence of fire in these types of stands has encouraged a dramatic increase in the amount of fir in the forest understory, which has prompted the outbreak and extended the natural cycle of the spruce budworm.

Other damaging agents include mountain pine beetle, western pine beetle, Douglas-fir tussock moth, fir engraver beetles, stem decays, dwarf mistletoes, and root rots.

Minerals

No known mining activities or mineral deposits exist.

There are no known gas or oil leases.

Recreation and Wilderness Use

Visitor use is undocumented.

There are two dispersed recreation sites at Big Ford: Kelsey Springs and Owl Creek each have one site. Mud Springs, a semi-developed campground, is on the south rim outside the Wilderness where the trailhead of the South Prong trail is located. There is a dispersed recreation site at Dusty Well, where the Black Canyon trailhead is located. There are three or four sites at Humphrey Camp.

Hunting is the major use of the wilderness; big game hunting is considered to have a short-term impact each year in Black Canyon Wilderness. Other uses are fishing in Black Canyon Creek in the spring and summer, and hiking and trail riding in the spring, summer and fall. There has been no interest in outfitter/guide services, but hunter camps do exist along the boundary.

Trails - The Black Canyon Wilderness has four designated trails in the area. The following is a list of trails, the trail numbers, and the maintenance levels:

Table 2

<table>

</tr>
<tr>
<td>Total Miles</td>
<td>18.9</td>
<td></td>
</tr>
</tbody>
</table>
Trailheads and Signing - There are no trailhead developments. There are some metal trail mileage markers and some wooden trail signs.

Wilderness Boundary - The wilderness area boundary has been partially located and posted on the ground. Most of Black Canyon Wilderness is bounded by the Ochoco National Forest except for the east end. Steuber’s Black Canyon Ranch borders the wilderness area for 2.75 miles, and BLM land borders the wilderness for 2.75 miles.

Specific Management Direction

Facilities - Eliminate nonconforming uses, hunter caches, and the cabin at Owl Creek.

Forage - Manage livestock grazing allotments according to their existing plans. Update allotment plans to reflect wilderness resource requirements. Maintain fences and developments according to wilderness and allotment management plans. Investigate and take action to prevent livestock trespass. Consider Mud Springs for development as a Horse Camp. In allotment planning, figure recreational stock forage needs as well as permitted livestock.

Recreation - Complete a wilderness resource spectrum (WRS) survey and inventory information on visitor use, using code-a-site methods.

Develop a “Limits of Acceptable Change” plan to serve as a monitoring guide for management of the wilderness.

Soil - Develop a plan to rehabilitate firelines and remove debris from Young’s Butte Fire Camp.

Water - Have a fisheries biologist and/or Forest hydrologist inventory Black Canyon Creek to acquire baseline data and collect water baseline data.

Bridge Creek Wilderness

(MA-F2)

Description

The 5,400-acre Bridge Creek Wilderness is located in the Ochoco Mountains in Wheeler County, central Oregon.

The topography of the Wilderness is characterized by a steep dissected drainage along Bridge Creek, with rolling open meadows on the side slopes. Two high peaks, East Point and North Point, reach elevations of 6,625 feet and 6,607 feet respectively. The lowest point along the northern edge of Bridge Creek is 4,000 feet in elevation. Rolling high mountain meadows characterize the south por-
tion of the area, while dense, suppressed white fir and lodgepole pine thickets, aging 70-90 years old, characterize most of the center core of the Wilderness. The far northern section also contains old growth ponderosa pine and Douglas-fir stands. There are small pockets of mountain mahogany, alder, and juniper.

Bridge Creek and Maxwell Creek are within the Wilderness. There are also five springs: Thompson, Piasgh, Masterson, Nelson, and Maxwell springs. Maxwell Reservoir is a small, three-acre lake sometimes used for irrigation.

Management Situation

Wilderness Resource Spectrum

Although the Wilderness is small, it can be managed in two Wilderness Resource Spectrum (WRS) classes. Map A outlines the two areas, one of which will be managed to meet primitive wilderness guidelines, and the other will be managed as semiprimitive. The primitive area encompasses the core of the Wilderness and consists of 3,000 acres. The surrounding area will be managed as semiprimitive, and encompasses the areas where man’s influence is evident and can not be mitigated due to pre-existing special uses such as the flume and irrigation ditch. In the semiprimitive area, outside management activities will have some influence visually and experience-wise for the wilderness visitor. This area is 2,400 acres.

Access

Primary access routes to the Wilderness are Forest Roads 2630, 2630-450, and 2360-750. These roads are maintained at a low level. An old road leads from Forest Road 2360 up to the Old Tree Lookout on North Point; although the road is blocked, it is very evident. The center is revegetating naturally but the two ruts are compacted and very visible.

There are a series of fire roads along the ridge on North Point which are evident. A logging road owned by Prineville Sawmill was built into the Wilderness in the NW 1/4 of Section 1, T.13 S., R.12 E., and has since been closed and obliterated. An old jeep trail and road enter the Wilderness on the north boundary from the 450 spur; although they are blocked, they are evident. Other roads are planned for adjacent timber sales which adjoin the Wilderness boundary.

There is private land on the north boundary of the Wilderness.

Biological Diversity

Vegetation occurs in three basic zones: 1) There are riparian zones along Bridge Creek and Maxwell Creek characterized by aspen stands interspersed with meadows dominated by grasses and forbs. 2) The north slopes of the Bridge Creek drainage are characterized by open mountain meadows with mountain mahogany and a profusion of wildflowers. 3) The remainder of the Wilderness (65 percent) is white fir and lodgepole pine stands. The stands are stagnant and dense with little floor cover or grasses. Areas of compaction may exist from cattle.
trails. Recreational use has not appeared to effect any vegetation. No known threatened or endangered plants have been located in the area, however, a survey has not been undertaken.

**Cultural Resources**

Although the central portions of the Wilderness have not been formally surveyed for cultural resources, the northern and southern perimeters have. In Northside #2 (Johnson, 1980) and Northpole (Bedortha, 1982) timber sale areas, both Euro-American (historic) and Native American (prehistoric) sites were found.

Mitchell Water Development (Gowan, 1985) failed to turn up notes, but resulted in a more intensive look at one of the prehistoric sites recorded by Johnson in 1980.

Historic activity in the Wilderness began in the late 1800's and centered around the water resources of Bridge Creek. Three historic sites are associated with this activity. Both Maxwell reservoir and Maxwell ditch (EA 68) were constructed by Maxwell in 1894. The water was used for irrigation on his private land holdings north of the Forest boundary. Prior to 1917, the Cole family (descendants of Maxwell) built a wagon road (EA 66) to Maxwell reservoir to gain access to the irrigation system and, presumably, to drive sheep and later cattle into the area for summer grazing. Around the turn of the century, the Forest Service began to develop the area to administer and protect resources in the area. The rest of the documented historic sites in the Wilderness are reflective of this new activity. First, the Summit Trail was built, between 1907 and 1909, to provide a travel system for Forest Rangers, stockmen, and their herds of sheep or cattle. This trail provided the main thoroughfare through the Forest and set up the first lines of communication. It runs along the southern boundary of the Wilderness and roughly corresponds to Forest Road 2630. It has been thoroughly documented by A. Gowan (1986), and has been determined eligible for nomination to the National Register of Historic Places. A trail from Pisgah Lookout to Bridge Creek, is one of the ancillary trails that tied into the Summit Trail. A series of guard stations to house the rangers and fire lookouts was established along the Summit Trail after its construction. Pisgah Guard Station (no longer standing) and North Point Lookout Tree are examples of these activities. These were linked together by magnetic phone lines around 1910 and provided much quicker communication throughout the Forest. The phone lines generally followed the transportation routes and are present in the Wilderness; the line from North Point Lookout Tree to Pisgah Guard Station is an example. Additional possible historic developments dating to this period are log troughs, slat logs, fence lines and stock driveways.

Three prehistoric sites are located within or near the Wilderness area; Native American (NA) 123 and NA 124 are located just north of the Wilderness; NA 128 is located at the upper end of Bridge Creek. All of these sites are located on nearly level ground near water sources or wet meadows. All are lithic scatters and have stone tools and debris from tool manufacture. They indicate that hunting
for big game occurred in the Wilderness area. The projectile points found at these sites indicate that activity began 5000 years ago.

Facilities
There are presently no Forest Service facilities within the wilderness except range fencing and an old historic tree lookout.

Fire
Historically fire has played a major role within the Wilderness. Old growth larch patches indicate forest scars. These scars show that fires occur in 100-400 year cycles, with larch ages ranging from 70-300 years old. Fire size ranges from small, 30-acre burns to 200-plus acres. It appears that fire suppression has not greatly affected much of the natural ecological cycle. Many of the timber stands are 70-100 years old, with dense thickets of lodgepole pine, white fir, and heavy fuel loading. Mt. Pisgah Lookout is located directly south of the Wilderness and is still used for fire detection purposes.

Forage
Two grazing permits exist in the Wilderness. Approximately 440 acres of the Wilderness are within the Badger Allotment, of which a total of 290 acres are suitable for grazing. This allotment is located in the northwest corner of the Badger Creek pasture. The allotment is managed as eight pastures. Five of these pastures are managed on a deferred basis, and three of the pastures are in riparian areas. Of these three riparian pastures, two are managed on a two-year rotation. Badger Creek pasture produces about 22 percent of the total production, or 450 animal unit months (AUM's). The pasture is utilized at alternate times of the year, for 40-60 days for approximately 220 head. The portion of the Wilderness within this pasture is small; the range condition is good.

The Elkhorn Allotment includes much of the Wilderness. Approximately 80 percent of the north pasture in this allotment is in the Wilderness. There are currently two permittees. Pat Clark is permitted to graze 50 yearlings for two months, and John Lillicrop is permitted 290 pair for 30-40 days. The allotment is under a deferred rotation grazing system; usually this pasture is utilized in the later part of the grazing season.

Forest Health
Insects and Disease - The pine bark beetle infestation is on the decline in the lodgepole pine (LP). Spruce budworm is currently infesting trees in the area. Stand exams conducted in 1979 found that about 60 percent of the white fir and lodgepole pine were infected. Recent aerial photos show that about 80 percent of the stand is affected.

Recreation and Wilderness Use
Accurate records of recreational use are not available. It is estimated that the area receives less than 100 recreation visitor days (RVD's) of use during the non-
hunting season. Hunters use the area during the day, and camp on the boundary, contributing approximately another estimated 600 RVD's of use, for a total use figure of about 700 RVD's per year. Horse use is minimal since travel through the area is difficult.

Carrying capacity estimates were made. The primitive WRS class may handle 0.6 RVD/AC/Yr and the semiprimitive class 0.75 RVD/AC/Yr. However many of the areas in the Wilderness are not readily accessible due to dense forest stands, and they were not considered in the carrying capacity estimates.

Table 3 shows how the carrying capacity for each WRS zone was calculated. These calculations show that the Wilderness is not used to its estimated capacity.

</table>

Four fire rings have been found in the Wilderness near North Point; fire rings have not been found elsewhere.

Hunting use in the Bridge Creek area is heavy and will continue to increase yearly. On opening day of archery season in 1987 began with 18 people counted; now (1989) approximately 20-25 people will hunt within the wilderness daily during archery season. On opening day of deer hunting season there were over 50 people hunting the area, and about 20-25 people daily during elk hunting season.

Road access into the area is blocked by snow from about mid-November to mid-June each year. Snowmobilers have been seen using the meadows inside the Wilderness just off Forest Road 2630 by Bridge Creek.

Carrol Camp is a historic camping area used by the Ochoco National Forest since it was founded in 1907. The camp is located on the mid-southern boundary of the Wilderness. It has a spring with potable water, one vault toilet and level camping places for no more than two parties. There are many dispersed hunter camps located around the periphery of the area, used primarily during the three week span of elk and deer hunting seasons.

**Trails** - There are no maintained trails within the Wilderness. An old 3.5 mile trail runs along the west side of Bridge Creek from the south boundary to Maxwell Reservoir. It is unsigned, has not been maintained for many years, and is difficult to find and follow in many places. The old road from Mt. Pisgah to the Old Lookout Tree on North Point is unsigned, and is now used as a trail by many
hunters and some hikers. There is also an old jeep trail maintenance road on the northern boundary that is used as hiking access into the Wilderness. An easily followed unsigned trail/road goes along the irrigation ditch, flume and pipe along Maxwell Creek and Bridge Creek.

**Trailheads** - There are no maintained trailheads for Bridge Creek Wilderness. The major entry route is near the wilderness sign by Bridge Creek where it crosses Forest Road 2360.

**Signing** - Bridge Creek Wilderness is signed with two large wilderness signs, and there are boundary signs posted about every 200 feet.

**Scenic Resources**
The visual quality within the Wilderness area is in a near natural state. Alterations are minor and include some old cattle fences, and the flume and irrigation ditch. Views from North Point and East Point present a vast 360 degree view of middleground and background. Present intrusions in the middleground include a few clearcuts on the northeast side of the District, but there are several timber sales planned in the areas near the Wilderness in the 1990's. Many of these clearcuts will be visible in mid- to foreground views from East Point and North Point.

The Old Summit Trail follows Forest Road 2630 for a large portion of the south Wilderness boundary. A visual resource management plan for the road has been developed.

**Water Resources**
The Lillicrop family has existing water rights in the Wilderness. Their permit includes maintaining an irrigation ditch, a wooden flume, reservoir and access road. It is located in T.12 S., R.21 E., Sections 27 and 34. The ditch is one and one-half miles long, 18 inches wide and 10 inches deep. The originating point for the ditch is a rubble/log dam in Bridge Creek, NE 1/4 Section 3, T.13 S., R.21 E. The wooden flume is one-fourth mile long, 14 inches wide and eight inches deep. The reservoir holds three-acre feet of water and covers one acre of land. The unimproved road is three-fourths mile long and eight feet wide. The wooden flume and some of the pipe and road are not within the Wilderness boundaries. A portion of the dam and flume are within the Wilderness. A review of this permit in 1986, revealed resource damage due to poor maintenance of the flume and ditch, including sluffing of head walls and creek erosion. The review required these problems to be corrected.

The city of Mitchell uses three springs just north of the Wilderness boundary for its water supply. Although these springs are not within the Wilderness, the citizens are concerned with any action in the Bridge Creek Wilderness that may affect their water supply (i.e. quality or quantity of water from their springs).

**Fisheries** - Bridge Creek is a tributary of the North Fork of the John Day River. It is a Class I stream with anadromous (steelhead) and resident rainbow trout spawning and rearing within the area. The stream is presently in good shape and
relatively unaffected by man-induced impacts with the exception of past livestock grazing in the first one-half to one mile below Pisgah springs. In the areas of higher gradient below the wet meadow (one mile south of Pisgah springs) for approximately one-half mile, livestock grazing has significantly altered the site potential and reduced stream condition to poor. When the stream drops into a deep narrow V-shaped profile, cattle grazing impacts are less, and the creek is in generally good condition down to the Wilderness boundary.

Wildlife

The Wilderness provides habitat for old growth dependent species. The area has good structural diversity with multiple canopy layers and open meadows. Edge effect is very prominent in many areas and will be increased by logging around the periphery of the Wilderness. Cover and security will become increasingly important in the Wilderness as other areas of the Forest are modified. Snags are very prominent and provide habitat for cavity dependent species.

Specific Management Direction

Forage - Currently there is no allotment plan for Elkhorn Allotment; Badger Allotment does have a current plan, which will be revised to incorporate guidelines in Forest Service Manual (FSM) 2323.2. Grazing impact on stream quality of Bridge Creek and Maxwell Creek will be monitored. An allotment management plan for Elkhorn will be completed within this planning period and incorporate wilderness grazing guidelines.

Recreation - The old road to North Point Lookout may still serve as a trail, but it will not be signed or put on the wilderness map.

If monitoring shows that recreational use is increasing and cross-country travel routes are affecting meadows and other wilderness characteristics, a trail system will be planned for the area.

Add one large wilderness sign by the fence, at the end of the old East Point road at the base of East Point.

Improve wilderness boundary signs along the Maxwell Reservoir area.

Maintain Carrol Camp as a minimally developed recreation site.

Collect better use data by constructing a registration box or installing a sensor at the information board.

Create a wilderness information board at the junction of Forest Road 2630 and the 450 spur. This will include a map of the wilderness, to be used as an education place. The untrailed character of the area will be explained, as well as safety and cross-country travel tips for the user.

Scenic Resources - The visual management plan for the Old Summit Trail along Forest Road 2630 will address removal of hazard trees along the road corridor while continuing to maintain retention objectives in the long term. Removal of hazard trees and firewood may mean that retention objectives might not be met in the short term since the present condition of the stand is very poor.
Foreground and middleground views from North Point and East Point will be addressed in timber sale environmental assessments.

**Transportation** - The old Forest Service road that accesses North Point Lookout will be obliterated after consultation and approval from the State Historic Preservation Office (SHPO). Proper photos and other necessary documentation will be submitted.

Any roads built adjacent to the Wilderness boundary as a result of new timber sales will be closed off when use is completed. They should be blocked within no less than one mile of the Wilderness boundary.

All roads now within the Wilderness will be blocked and revegetated. Ruts will be tilled along all old firelines, fire roads, jeep trails and logging roads. The North Point Lookout road will be analyzed for historic significance; if it is found to be insignificant, it will be obliterated.

Forest Road 2630 from the junction of Forest Road 2630-450, and also Forest Road 2630-450 on the northern boundary, will be maintained for high clearance vehicles.

**Water** - The flume and irrigation ditch present some erosion problems along Bridge Creek. Permittees maintenance of permit structures will continue to be monitored. If preventable resource deterioration occurs, permittees must improve the structures within the Wilderness; in some cases bank stabilization will be needed.

Stream surveys will be conducted to determine the condition of the stream channel. Recommendations made by the State of Oregon and ODFW will also be sought within the wilderness context.
LIMITS OF ACCEPTABLE CHANGE

The following monitoring plan implements the concept of Limits of Acceptable Change. It is designed to assess human-caused impacts on the wilderness resource, and sets parameters for management actions.

Mill Creek Wilderness

(MA-F3)

Description
Eighty-five percent of the Wilderness lies within the Mill Creek watershed, with the remainder in the Marks Creek watershed; both are tributaries of Ochoco Creek. Although generally southerly-oriented, all exposures are represented. Parts of Desolation Canyon and the west slope of Wildcat Ridge exceed 100 percent side slopes, with rock outcrops. Two-thirds of the area has slopes greater than 30 percent gradient. In sharp contrast, the meadows, prairies, and lodgepole pine thickets in the north end are nearly flat. Fifteen percent of the Wilderness is in openings, mostly barren ridge tops and some high-elevation meadows. The west half of the Wilderness is mostly high rolling hills. Elevations range from 3,725 feet at Wildcat Campground to 6,240 feet at the northeast corner of Viewpoint Lookout. The terrain varies from the rugged, rocky cliffs of Desolation Canyon to the flat meadows of Bingham Prairie. Spectacular rock outcrops are present at Twin Pillars and Whistler Point. Twin Pillars is a 200-foot tall lava tower, the remaining plug of an eroded volcano. A rhyolite ash deposit welded together to form the resistant tuff outcropping at Whistler Point.

There are 5.1 miles of Class I stream (East Fork Mill Creek); 3.9 miles of Class II streams (Belknap, Brogan, Buck, McGinnis, Reilly, Cornez, and Hamilton Creeks); 8.9 miles of Class III streams; and 10.2 miles of Class IV streams in the Wilderness.

The Wilderness has a variety of plant communities, including mixed conifer-pinegrass, white fir-twinflower, juniper-bunchgrass, ponderosa pine-wheatgrass, lodgepole pine-pinegrass, and meadow-shrub associations. Most of the forested area has a ponderosa pine overstory (greater than 200 years old) with a Douglas-fir and white fir understory (less than 100 years old).

Specimens of little grape fern (Botrychium simplex), a sensitive plant species, have been found in moist meadows within Bingham and Moccasin Prairies and Trail Meadow.

Management Situation
Access
The Wilderness is 15 miles northeast of Prineville. Access is provided by Forest Road 27 on the north and Forest Roads 33 and 3350-300 on the south. It is the most readily accessible wilderness on the Forest Road access is blocked by snow except at the southern access point from about mid-November to June. The northeast area can be accessible by skiing from an adjacent cross-country skiing trail system at Bandit Springs off Highway 26.
Cultural Resources

A cultural resource survey of the trail system has been completed and no cultural resources have been identified on the trails. Throughout portions of the Wilderness, clusters of obsidian and agate tools have been located. Subsurface sites have been found along the Mill Creek drainage, with a high probability that Native Americans camped in the area. Known historic features include early lookouts (Wildcat Mountain, Viewpoint, Whistler Point), sheep camps, and gold robber campsite.

Facilities

Nonconforming Structures - As a result of recent and past activities, many non-conforming structures still exist, including concrete water tanks, nonfunctioning fences, a shelter, obvious campsites with fire rings, rustic wooden tables, benches, bridges, and old vehicle trails.

Fire, Insects and Disease

Fuel loading varies from less than one ton per acre in meadows, to up to 45 tons per acre in decadent lodgepole pine stands. Old growth ponderosa pine stands with ground fuels and ladder fuels comprise a majority of the area. Fuel accumulation is increasing due to insect and disease and the exclusion of fire. Fire hazard is rising throughout the Wilderness, particularly in the lodgepole pine stands in the northern portions. Fire occurrence is every 15 to 30 years. The natural fires are primarily caused by lightning; one strike per year is usual.

Fire suppression has largely influenced the amount and distribution of insects and disease. Mountain pine beetle populations have just passed cycle peaks in the decadent lodgepole pine stands and are peaking in the ponderosa pine stands. Root-rot and spruce budworms are common in mixed-conifer stands, with the latter declining from peak populations. There is high likelihood of spread within the Wilderness and moderate potential for the spread of these species to outside areas.

Forage

The Wilderness lies within the Mill Creek and Bear Creek (Prineville Ranger District) and Wildcat (Big Summit Ranger District) Allotments. About 535 cow-calf pairs graze in various periods during June through September. Both allotments are under deferred-rotation grazing systems and show good livestock distribution and stable trends. Range improvements include about 10.5 miles of wire fence, five spring developments, and one stock pond. Access to, and maintenance of these improvements has traditionally been accomplished via mechanized means (with Forest Supervisor approval), or by horseback.

Minerals

Substantial deposits of agate and thundereggs are the focal points for nine unpatented mining claims. The Wilderness has been withdrawn from any mineral or energy development. Table 5 contains a list of claims.

These roads are currently authorized for mining operations: Forest Road 33-205 (1.2 miles), Forest Road 27-300 (2.3 miles), and Forest Road 27-301 (.6 mile).

Recreation and Wilderness Use

Opportunities for solitude are very high during the winter. During the main summer-use season, opportunities for solitude are moderate to high within the Wilderness interior. The opportunity for solitude is low in many areas due to roads close to or on the boundary.

Popular campsites are located primarily along the northern Wilderness boundary due to easy road access. The most frequented interior camping area is at the junction of Twin Pillars and Belknap Creek Trails. Many campsites are evident immediately adjacent to the lower two miles of the Twin Pillars Trail.

Wilderness use approximates 500 to 1,000 recreation visitor-days (RVD’s) per year. Most use is day-use. Minor change in the traditional types or amounts of recreational use has occurred since the Wilderness designation, however there has been increased horseback riding and hunting. Although concrete data is lacking, observations suggest use occurrence/significance is in the following order:

Hiking
Horseback Riding
Hunting
Fishing
Camping/Backpacking
Nature Study
Cross-country Skiing
Rockhounding
Gold Panning
Most recreational use focuses on the East Fork Mill Creek corridor between Wildcat Campground and Belknap Creek, and between Bingham Prairie and Twin Pillars. Users generally park or camp at Wildcat Campground (and, to a lesser extent, at dispersed sites at Whistler Spring, White Rock, or Bingham Prairie) before beginning their treks.

Horseback riders usually park and camp at Wildcat Campground, resulting in periodic congestion of people and stock on the adjacent Twin Pillars Trail.

Hunting use is moderate to heavy, with about 10 to 40 groups of two to eight regularly observed at the developed and dispersed campsites adjacent to the Wilderness.

The only recently-issued special-use permit provides for handicapped recreation along the Twin Pillars Trail near Wildcat Campground. No inquiries have been received from outfitter/guide or related organizations.

There are no encumbers or private lands within the Wilderness.

**Trails** - There are 18 miles of maintained trails which include two north-south routes - Twin Pillars and Wildcat Mountain Trail. There is one connector trail, the Belknap Creek Trail (three miles). Twin Pillars Trail (seven miles) covers the route from Wildcat Campground to Bingham Prairie, via Twin Pillars. Wildcat Mountain Trail (eight miles) covers the eastern ridge. Maintained trail density is about .8 trail miles per square mile. Remnants of old trails are intermittent along the East Fork Mill Creek, Desolation Canyon, and in the vicinity of Whistler Spring. There are 3.5 miles of the historic Summit Stock Driveway in the northeastern portion.

**Trailheads** - Four trailheads are available out of the campgrounds or dispersed sited outside of the Wilderness. Wildcat Campground and Bingham Prairie are trailheads for both ends of the Twin Pillars Trail. White Rock and Whistler Dispersed Campgrounds are trailheads for both ends of the Wildcat Mountain Trail. Parking capacity is displayed in Table 6.

About 16 miles of old tracks or roads also exist, with 32 access points; most of these have not been rehabilitated. Nearly all of these tracks or roads are passable by motorcycles and similar single-passenger vehicles, and many by four-wheel drive vehicles. Historic use has been by mining claimants, grazing permittees, hunters, and off-road vehicle (ORV) enthusiasts. Most roads were constructed.
by mining claimants or fence contractors. A “Baseline Inventory Report” summarizes road accessibility, manageability, and condition. Entrance management, i.e., blocking, has been initiated on all of these except where use is otherwise authorized, e.g., mining claims.

Signing - Boundary signs have been posted around all the trail and road access points. Trail signs are present at trailheads and junctions. Some signs display more information than specified by the FSM, and some are made of synthetic materials.

Water Resources
Riparian Condition - About 12.5 miles of stream are in acceptable riparian condition, with about seven miles in a degraded condition. Deciduous shrubs provide intermittent shading along portions of East Fork Mill Creek. Portions are devoid of adequate shade due to lack of potential and past grazing practices, although shrub density and cover is increasing in response to management change. Recreational use has been concentrated in some campsites, particularly along East Fork Mill Creek, resulting in reduced ground cover.

Wildlife and Vegetation
The Wilderness is deer summer range, and elk summer and winter range. Although below potential, much of the area is in an old growth condition and provides excellent habitat for wildlife such as pileated woodpecker and marten. The wide diversity of habitats, including the abundant riparian zones, cliffs, and forest and meadow “edges,” provide for many wildlife species.

East Fork Mill and Buck Creeks support rainbow trout and are managed as put-and-take fisheries. Due to low summer/fall flows and low levels of shading and instream woody material in some areas, habitat is below potential.

Specific Management Direction
Cultural Resources - Manage the Summit Stock Driveway to retain its historical features.

Fire - Allow no more than 1,500 acres burned at Fire Intensity Level III per decade. Allow no more than 5,000 total acres burned per decade by wildfire or prescribed fire.

Use both natural and planned ignitions to re-introduce a natural fire cycle over 20 percent of the Wilderness (about 3,500 acres) each decade.

Forage - Schedule grazing use to minimize conflict with periods of heavy recreational use (especially July, August, October, and November) if physical resource protection objectives can be achieved.

Inform users when livestock are in the Wilderness to reduce conflicts.
Require the burial, removal, or disposal of any carcass that presents a potential for spreading disease, by a methods approved in advance by the District Ranger. Leave no carcass within 500 feet of any spring, pond, creek, trail, campsite, or vantage point.

Pack all salt in by horseback. Place salt at least .25 miles from vantage points, campsites, and designated trails.

Allow vegetation/litter cover change on no more than 10 percent of the Wilderness (1,740 acres) in any 10-year period.

Allow no more than a 50 percent loss of the ground cover within the general area of a fire circle and tent location. Allow no more than three percent of any campsite area to lose vegetative cover in any 10-year period.

In primitive areas, allow vegetative loss on no more than one percent of any acre. Allow four or fewer trees with exposed roots per impacted site.

In semiprimitive areas, allow vegetative loss on no more than 1.5 percent of any acre. Allow six or fewer trees with exposed roots per impacted site.

**Recreation** - Manage for the primitive and semiprimitive WRS.

In primitive WRS areas, provide no more than one sign with a maximum of two route indicators at a trail junction.

In semiprimitive WRS areas, provide no more than two directional signs with a maximum of two route indicators at a trail junction.

Allow no marking of nordic trail routes.

Limit signing to directional signs at trail junctions and necessary temporary administrative signs. Provide no distance or destination signing. Provide no signing of geographic features.

Limit recreation visitor days (RVD's) to the carrying capacity of 12,690 RVD's in the primitive area during the summer use season, and 4,690 RVD's in the winter season.

Limit RVD's to the carrying capacity of 3,700 in the semiprimitive area during the summer use season, and 670 RVD's in the winter season.

Require that pets be under physical restraint. Pets can be banned for protection of wildlife and to decrease resource impacts.

Provide information at trailheads and Forest Service offices, including resource protection information, wilderness ethics, wilderness safety, and maps.

Set up registration systems at trailheads as needed.

Avoid low Visual Absorption Capability (VAC) areas for campsites, trailheads, and trails where possible. VAC is the relative ability of the land to be impacted by human activities without being adversely affected visually.

MA-F3 Mill Creek Wilderness
Management Area Standards and Guidelines

Resource - Facilities

Practice
Construction, Reconstruction and Maintenance of Administrative Buildings and Structures

Standard and Guideline
No administrative buildings or structures allowed.

Applicable Management Area
MA-F1 Black Canyon Wilderness
MA-F2 Bridge Creek Wilderness
MA-F3 Mill Creek Wilderness

Practice
Nonconforming Structures

Standard and Guideline
Remove, eliminate, or disguise all nonconforming structures. Retain existing bridges until unusable, then remove without any replacement structures.

Applicable Management Area
MA-F3 Mill Creek Wilderness

Management Area Standards and Guidelines

Resource - Fire

Practice
Fire Suppression (P04)

Standard and Guideline
Confine and contain will be the principle suppression strategies on most natural ignition (lightning) fires. Control strategy will be invoked when lightning fires threaten to escape the Wilderness Areas or pose unacceptable risks to life or wilderness values. Use the “light hand on the land” techniques.
Suppression activities should minimize disturbances of the land surface.

Use of chainsaws, helicopters, air tankers, or pumps must be approved by the Forest Supervisor. Allow no helispot construction for initial attack.

Crawler tractors will not be used without prior approval from the Regional Forester.

**Applicable Management Area**
- MA-F1 Black Canyon Wilderness
- MA-F2 Bridge Creek Wilderness
- MA-F3 Mill Creek Wilderness

---

**Practice**

**Treatment of Natural Fuels (P12)**

**Standard and Guideline**
Naturally caused ignitions may be allowed to burn if they meet conditions in an approved prescribed burn plan, and funds and necessary staffing are available.

Planned ignitions may be used within wilderness areas if that is the best way of returning fire to its natural role. This is accomplished by reducing the fuels profile to natural levels and with less risk of damaging the wilderness resource. Planned ignitions within the Wilderness are also permitted if there is no other practical and economic way to lessen the likelihood of the escape of damaging wildfire from the Wilderness.

**Applicable Management Area**
- MA-F1 Black Canyon Wilderness
- MA-F2 Bridge Creek Wilderness
- MA-F3 Mill Creek Wilderness

---

**Practice**

**Fuel Break Construction and Maintenance (P13, P14)**

**Standard and Guideline**
Limited shaded fuelbreak segments may be constructed along boundaries to take advantage of logical natural terrain features aiding in the prevention of fire spread across management area boundaries. The majority of such fuel break systems will be outside of the area.

**Applicable Management Area**

Appendix I

Management of Wild Horses

Objectives

The objective of managing wild and free roaming horses on the Ochoco National Forest is to provide for their protection, management, and control in a manner consistent with the Wild and Free Roaming Horse and Burro Act of 1971 and subsequent amendments.

These horses will be managed under the authority of Public Law 92-195 (85 Stat. 649, 16 USC 1331-1340). Other laws applicable to National Forest System lands also apply to the administration of these animals. Management actions must be consistent with the intent of the Multiple Use-Sustained Yield Act of 1960 (74 Stat. 215, 16 USC 528-531).

Operations

The bands of horses within the original territory will be managed at a maximum of 60 head. When horse numbers exceed this level removal of excess horses will be required. The Forest has experienced difficulty in getting horses from this territory adopted because of their undesirable size and confirmation. In order to improve the adoptability factor over the next few years, excess animals will be selectively removed. Initially, animals to be retained in the herd will be selected on the basis of physical soundness, quality of conformation, and young breeding age. This will result in a base herd which is healthy, vigorous, and of a quality that will produce adoptable offspring.

Horses that establish new territories beyond those which they inhabited prior to December 1971 are designated excess animals in accordance with the 1971 Act. These horses will be first priority for removal, and will be captured and put up for adoption.

Excess horses removed from the territory will be disposed of through horse adoption procedures in accordance with the Interagency Agreement between the Bureau of Land Management and the Forest Service signed in December 1988.

Management will be directed toward the overall herd as a viable unit, instead of toward certain bands or individuals within the herd.

Various practices will be used in removing excess horses. Included are the use of roundups, tranquilizer darts, and catch pens. The use of aircraft will be limited to locating and inventorying animals, and in observing approved removal efforts.

Excess animals which are too old, too lame, or permanently injured may be removed using lethal doses from tranquilizer guns. Judgement will be exercised in these cases. All disposal activities will be in accordance with State Health codes.

GLOSSARY

These definitions apply to Forest Service land management and planning. Meanings may differ when used in another context. Some definitions were shortened, paraphrased or adapted to fit local conditions. Definitions of other terms used in resource management but not included in this glossary may be found in the following publications.

**ACCEPTABLE RIPARIAN CONDITION** - A shady, brushy riparian condition with frequent amounts of tall overstory conifer trees and shorter hardwoods of alder, willow and aspen; the site has the potential to produce conifers and/or hardwood species. Moderately gentle bank slopes containing moderate to high plant densities, thick root masses, embedded angular boulders and old logs characterize these areas. Frequent channel scouring and deposition will largely be replaced by mossy aquatic growth on assorted sizes of tightly packed rocks.

**ACRE EQUIVALENT** - Used to adjust actual acres of habitat improvement or improvement structures to reflect overall habitat benefits derived. It reflects the zone of influence of the habitat improvement for the target species. For example, a single water development for upland game birds has an acre equivalent of 160, whereas a single water structure for big game has a value of 640 because it has a larger zone of influence for the more mobile big-game animals.

**ACRE FOOT (ACF)** - A unit for measuring a volume of water. Quantity of water required to cover 1 acre (43,560 square feet) to a depth of 1 foot.

**ACRES OF DEGRADED WATERSHED CONDITION** - Represents existing soil/watershed areas which are degraded and contributing to loss in site productivity and/or creating water quality deterioration when hazardous events occur. The Soil/Water Restoration Inventory (1979) for the Ochoco National Forest (located at the Ranger District Offices) delineates these areas.

**ACTIVITY** - Actions, measures, or treatments that are undertaken that directly or indirectly produce, enhance, or maintain forest and rangeland outputs or achieve administrative or environmental quality objectives. Forest Service activity definitions, codes, and units of measure are contained in the Management Information Handbook (FSM 1309 11).

**ADVISORY COUNCIL ON HISTORIC PRESERVATION (ACHP)** - An independent advisory body established by the National Historic Preservation Act of 1966. The mission of the Council is to advise the President and Congress on national historic preservation policies, to encourage private and public interest in historic preservation, and to review and comment on Federal undertakings that might have an effect on properties listed on or eligible for the National Register of Historic Places.
ALL-TERRAIN VEHICLE (ATV) - An abbreviation whose initials stand for All-Terrain Vehicle, which is any motorized off-highway vehicle 50 inches or less in width. ATV's usually have a dry weight of 600 pounds or less, traveling on three or more low pressure tires and having a seat designed to be straddled by the operator.

AIRSHED - A geographical area that, because of topography, meteorology, and climate, shares the same air.

ALLOCATEMENT - see Range Allotment.

ALLOWABLE SALE QUANTITY (ASQ) - (Comparable to programmed allowable harvest used in previous plans). The quantity of timber that may be sold from the area of suitable land covered by the forest plan for a time period specified by the plan. This allowable sale quantity (ASQ) is usually expressed on an annual basis as the "average annual allowable sale quantity." (FSM 1900).

ALL-TERRAIN VEHICLE (ATV) - Any motorized, off-highway vehicle 50 inches or less in width, having a dry weight of 600 pounds or less that travels on three or more low pressure tires with a seat designed to be straddled by the operator. Low-pressure tires are 6 inches or more in width and designed for use on wheel rim diameters of 12 inches or less, utilizing an operating pressure of 10 pounds per square inch (psi) or less as recommended by the vehicle manufacturer.

ALTERNATIVE - One of several policies, plans, or projects proposed for decision making.

AMENITY - An object, feature, quality, or experience that gives pleasure or is pleasing to the mind or senses. Amenity value is typically used in land-use planning to describe those resource properties for which market values (or noncash values) are not or cannot be established, such as hiking or scenic viewing.

ANADROMOUS FISH - Those species of fish that mature in the sea and migrate into streams to spawn. Salmon, steelhead, and sea-run cutthroat trout are examples.

ANALYSIS AREA - An area of land (not necessarily contiguous) which for FORPLAN analysis purposes has homogeneous timber management costs and vegetative responses to timber management activities.

ANALYSIS OF THE MANAGEMENT SITUATION (AMS) - A step required under the National Forest Management Act in which the Forest determines its ability to supply goods and services to meet society's demand for them.

ANIMAL UNIT (AU) - An animal unit is a 1,000 pound mature cow, or its equivalent based on an average daily forage consumption of 26 pounds dry matter per day.

ANIMAL UNIT MONTH (AUM) - The amount of forage required by an animal unit for one month.

ANNUAL PROGRAMMED HARVEST - That part of the potential timber yield that is scheduled for harvest in a specific year.

APPROPRIATE SUPPRESSION RESPONSE - The kind, amount, and timing of suppression action on a wildfire which most efficiently meets fire management direction under current and expected burning conditions. The action may be from prompt control to confinement. (See definitions for confine, contain, and control.)

AQUEOUS - Of, relating to, or resembling water.

ARCHAEOLOGY - The scientific study of the physical characteristics of cultural resources in order to describe and explain former ways of life.

ARTERIAL ROAD - Roads comprising the basic access network for National Forest System administrative and management activities. These roads serve all resource elements to a substantial extent, and maintenance is not normally determined by the activities of any one element. They provide service to large land areas and usually connect with public highways or other Forest arterial roads to form an integrated network of primary...
travel routes. The location and standards are often determined by a demand for maximum mobility and travel efficiency rather than by a specific resource management service. Usually they are developed and operated for long-term land and resource management purposes and constant service.

**B**

*Bacillus thuringiensis (B.t.)* - A biological agent used to initiate insecticidal treatments of the western spruce budworm populations.

**BACKGROUND** - The visible terrain beyond the foreground and middleground where individual trees are not visible, but are blended into the total fabric of the stand. (See "Foreground" and "Middleground.")

**BASALT** - A dark gray to black, fine-grained igneous rock.

**BENCHMARK** - An analysis of the supply potential of a particular resource, or of a set of resources subject to specific management objectives or constraints.

**BENEFIT COST RATIO** - An economic indicator of efficiency, computed by dividing total priced benefits by priced costs. Usually both benefits and costs are discounted so that the ratio reflects efficiency in terms of the present value of future benefits and costs.

**BEST MANAGEMENT PRACTICES (BMP)** - A specific activity, measure, course of action, or treatment.

**BIG GAME (BG)** - Those species of large mammals normally managed for sport hunting, generally elk, deer, and antelope.

**BIOLOGICAL DIVERSITY** - The distribution and abundance of different plant and animal communities and species within the area covered by a land and resource management plan.

**BIOLOGICAL POTENTIAL** - The maximum possible output of a given resource limited only by its inherent physical and biological characteristics.

**BOARD FOOT** - A unit of timber measurement equaling the amount of wood contained in an unfinished board 1 inch thick, 12 inches long, and 12 inches wide.

*Board foot volume measurement varies with size of trees and is designed for certain product specifications and current technology. Young stands that have been regenerated cannot be measured in board foot or equivalent units of measurement, attempting to do so would underestimate the biological potential of timber producing lands and make future growth estimates impossible. See cubic foot.

**BRECCIA** - A rock made up of highly angular coarse fragments.

**BROADCAST BURN** - Allowing a prescribed fire to burn over a designated area within well-defined boundaries for reduction of fuel hazard or as silvicultural treatment, or both.

**C**

**CANOPY CLOSURE** - The progressive reduction of space between crowns as they spread laterally, increasing the canopy density.

**CAPABILITY** - The potential of an area of land to produce resources, supply goods and services, and allow resource uses under an assumed set of management practices and at a given level of management intensity. Capability depends upon current conditions and site conditions such as climate, slope, landform, soils, and geology, as well as on the application of management practices, such as silviculture or protection from fire, insects, and disease.
CAPITAL INVESTMENT COST - Costs generally associated with construction such as trails, roads, and physical structures for range, recreation, and fish and wildlife. Other major functions include reforestation, timber stand improvement and prescribed burning.

CAVITY - The hollow excavated in trees by birds or other natural phenomena, used for roosting and reproduction by many birds and mammals.

CINNABAR - A mineral (HgS) which is the principal ore of mercury.

CLEARCUTTING - The harvesting in one cut of all trees on an area for the purpose of creating a new, even-aged stand. The area harvested may be a patch, strip, or stand large enough to be mapped or recorded as a separate class in planning for sustained yield.

COLLECTOR ROAD - Roads that serve smaller land areas than a Forest arterial road, and usually connected to a Forest arterial or public highway. Collect traffic from Forest local roads and/or terminal facilities. The location and standard are influenced by both long-term multiresource service needs, as well as travel efficiency. May be operated for either constant or intermittent service, depending on land use and resource management objectives for the area served by the facility.

COMMERCIAL FOREST LAND (CFL) - Forest land that is producing or is capable of producing crops of industrial wood and (a) has not been withdrawn by Congress, the Secretary, or the Chief; (b) existing technology and knowledge is available to ensure timber production without irreversible damage to soils productivity, or watershed conditions; and (c) existing technology and knowledge, as reflected in current research and experience, provides reasonable assurance that adequate restocking can be attained within 5 years after final harvesting.

COMMERCIAL THINNING - A cut in a stand under rotation age designed to remove excess merchantable trees. The objective is to place the growth capability of the site on the remaining leave trees.

COMMODOITY - A transportable resource product with commercial value; all resource products that are articles of commerce.

COMMON VARIETY MINERAL - Saleable minerals.

COMMUNITY COHESION - The degree of unity and cooperation evident in a community as it defines problems and attempts to resolve them.

COMMUNITY STABILITY - A community's capacity to handle change without major hardships or disruptions to component groups or institutions. Measurement of community stability requires identification of the type and rate of proposed change and an assessment of the community's capacity to accommodate that level of change.

COMPACTION, SOIL - The packing together of soil particles by forces exerted at the soil surface, resulting in increased soil density.

CONCERN - A point, matter, or question raised by management that must be addressed in the planning process.

CONFINE - To limit fire spread within a predetermined area principally by use of natural or preconstructed barriers or environmental conditions. Suppression action may be minimal and limited to surveillance under appropriate conditions.

CONSTANT SERVICE - A road developed and operated for continuous or annual recurrent service.

CONTAIN - To surround a fire, and any spot fires therefrom, with control line as needed, which can reasonably be expected to check the fire's spread under prevailing and predicted conditions.
CONTROL - To complete the control line around a fire, any spot fires therfrom, and any interior islands to be saved; burn out any unburned area adjacent to the fire side of the control line; and cool down all hot spots that are immediate threats to the control line, until the line can reasonably be expected to hold under foreseeable conditions.

CONVERSION PERIOD - A transition period during which an unregulated forest structure is converted to a regulated one. When regulated, the forest will have a distribution of stand age and size classes, providing approximately equal periodic harvests.

CORD - A unit of volume measurement containing 128 cubic feet of solid wood. Generally a stack of round or split wood measuring 4 feet wide by 4 feet high by 8 feet long.

CORRIDOR - A linear strip of land identified for the present or future location of transportation or utility rights-of-way within its boundaries.

COST EFFICIENCY - The usefulness of specified inputs (costs) to produce specified outputs (benefits). In measuring cost efficiency, some outputs, including environmental, economic, or social impacts, are not assigned monetary values, but are achieved at specified levels in the least cost manner. Cost efficiency is usually measured using present net value, although use of benefit-cost ratios and rates-of-return may be appropriate.

COVER/FORAGE RATIO - The ratio, in percent, of the amount of area in cover condition to that area in non-cover or forage condition; the criteria by which potential deer and elk use of an area is judged.

COVER - Vegetation used by wildlife for protection from predators, to ameliorate conditions of weather, or in which to reproduce.

CUBIC FOOT - In timber management a volume measured as a 1 foot cube of solid wood.

*Cultivation and inventory of forest stands is measured in units of cubic foot volume because it is independent of numerous product requirements occurring within a locale, region, or the nation as a whole.

CULMINATION OF MEAN ANNUAL INCREMENT (CMAI) - The age at which a stand of trees no longer increases in average annual growth.

CULTURAL RESOURCES - The remains of sites, structures, or objects used by humans in the past—historical or archaeological.

CULTURAL RESOURCES - Physical remains of districts, sites, structures, buildings, networks, or objects used by humans in the past. They may be historic, prehistoric, archaeological, or architectural in nature. Cultural resources are land based and are nonrenewable.

CUMULATIVE EFFECTS - The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

CURRENT DIRECTION - The direction contained within the following plans that have guided the recent management of the Forest and Grassland:

1. Ochoco-Crooked River Planning Unit Land Management Plan, 1979

GL - 5
DATA - Any recorded measurements, facts, evidence, or observations reduced to written, graphical, tabular, or computer forms.

DATA RECOVERY - Collection of information through any of a variety of techniques (e.g., photography, mapping, archaeological excavation) conducted for purposes of No Adverse Effect or mitigating Adverse Effect. Data collection is designed to recover representative data from a cultural resource prior to its disturbance or destruction.

DBH - Diameter at breast height. Diameter of a tree 4 feet 6 inches above the ground.

DECISION CRITERIA - Essentially the rules or standards used to evaluate alternatives. They are measurements or indicators that are designed to assist a decisionmaker in identifying a preferred choice from an array of possible alternatives.

DECISION VARIABLE - A component of an alternative in which input costs, outputs and benefits are identified and used for analysis and decision making.

DEMAND - The amount of goods or services that will be consumed if offered over a given range of prices at a particular point in time.

DEMOGRAPHIC - Pertaining to the study of the characteristics of human populations, such as size, growth, density, distribution, and vital statistics.

DEPARTURE (DEP) - Timber harvest schedule which deviates from the principle of nondeclining even flow by exhibiting a planned decrease in the timber sale and harvest schedule in the future. A departure is characterized as a temporary increase over the base sale schedule without impairing the Forest's long-term sustained-yield.

DETERMINATION OF ELIGIBILITY - Formal determination by the Keeper of the National Register, Department of Interior, as to whether or not a cultural resource is eligible for listing on the National Register of Historic Places.

DETERMINATION OF EFFECT - Determination of the effect (No Effect, No Adverse Effect, Adverse Effect) a proposed undertaking will have on cultural resources listed on or eligible for the National Register of Historic Places. Requires consultation with the State Historic Preservation Officer and may require review by or consultation with the Advisory Council on Historic Preservation.

DEVELOPED RECREATION - Recreation that requires facilities that, in turn, result in concentrated use of an area. Examples of recreation areas are campgrounds and ski areas, facilities in these areas might include roads, parking lots, picnic tables, toilets, drinking water, ski lifts, and buildings.

DISCOUNT RATE - The interest rate used in plan formulation and evaluation for discounting future benefits and computing costs, or otherwise converting benefits to a common time basis.

DISPERSED RECREATION - A general term referring to recreation use outside a developed recreation site; this includes activities such as scenic driving, hunting, backpacking, and recreation in primitive environments.

DISPERSION - To disperse the effects of timber harvest by distributing harvest units more or less uniformly throughout a drainage so that increased runoff and sediment from disturbed sites will be buffered by lower levels of runoff and sediment production from surrounding undisturbed lands.
DISTRICT - See Ranger District.

DIVERSITY - The distribution and abundance of different plant and animal communities and species within the area.

DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) - The version of the statement of environmental effects required for major Federal actions under Section 102 of the National Environmental Policy Act (NEPA) and released to the public and other agencies for review and comment. It is a formal document which must follow the requirements of NEPA, the Council on Environmental Quality (CEQ) Guidelines, and directives of the agency responsible for the project proposal.

EARNED HARVEST EFFECT (EHE) - An increase in the present harvest based on the expectation of increased yields in the future resulting from management practices such as planting genetically-improved stock and thinning.

ECONOMIC EFFICIENCY - See cost efficiency.

ECOSYSTEM - The interacting system of a biological community and its nonliving environment.

EDGE - The place where plant communities meet or where successional stages or vegetative conditions within plant communities come together. It often contains organisms from both communities as well as those restricted to the interface area. The number of species present is often greater than the surrounding communities.

EFFECTS - Environmental consequences as a result of a proposed action. Included are direct effects, which are caused by the action and occur at the same time and place, and indirect effects, which are caused by the action and are later in time or further removed in distance, but which are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems. Effects and impacts as used in the FEIS are synonymous. Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic quality, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effects will be beneficial (40 CFR 1508.8).

ELIGIBLE - Cultural properties that meet the criteria for listing on the National Register of Historic Places.

EMPIRICAL YIELD TABLE - A table reflecting the existing standing timber volumes today and how they would grow in the future, under various timber management regimes.

ENDANGERED SPECIES - Any species of animal or plant that is in danger of extinction throughout all or a significant portion of its range. Plant or animal species identified by the Secretary of the Interior as endangered in accordance with the 1973 Endangered Species Act.

ENDEMIC - A taxonomic category (e.g., genus, species, variety) whose natural occurrence is confined to a certain region and whose distribution is relatively limited.

ENDEMIC ORGANISM - A taxonomic category (e.g., genus, species, variety) whose natural occurrence is confined to a certain region and whose distribution is relatively limited.

ENHANCE - To improve, reinforce, enrich or strengthen the existing condition, value, or beauty of a resource.

ENHANCEMENT - Interpret cultural resources for the public benefit. Cooperate with museums, universities, and other recognized institutions, agencies, and knowledgeable persons in planning and constructing cultural resource exhibits involving National Forest System cultural resources. Coordinate these efforts with...
interpretive Services people (FSM 2390). Enhancement efforts may include the full range of interpretive techniques. Because enhancement may affect the resource, comply with regulations set forth in FSM 2366. In all cases consider a determination of beneficial effect (FSM 2366 26).

ENVIRONMENT - The sum of all external conditions and influence affecting the life, development, and survival of an organism.

ENVIRONMENTAL ANALYSIS - An analysis of alternative actions and their predictable short- and long-term environmental effects, incorporating the physical, biological, economic, social, and environmental design arts and their interactions.

ENVIRONMENTAL ASSESSMENT (EA) - A concise public document required by the regulations implementing the National Environmental Policy Act.

EPIDEMIC - An outbreak of sudden rapid spread, growth, or development.

EPITHERMAL MINERAL DEPOSIT - A deposit formed in rocks of shallow depth from low-temperature hydrothermal solutions.

EQUIVALENT CLEARCUT AREA (ECA) - That area which when harvested under any of the various silvicultural regimes produces hydrological effects similar to one acre of clearcut.

EQUIVALENT HARVEST AREA (EHA) - The same as Equivalent Clearcut Area (ECA).

EROSION - The processes whereby earthy or rocky material is worn away, loosened, dissolved and removed from any part of the earth’s surface.

EVAPOTRANSPIRATION - Process by which water moves from the soil to the atmosphere by evaporation from the soil or transpiration through plants.

EVEN-AGED MANAGEMENT - The application of a combination of actions that results in the creation of stands in which trees of essentially the same age grow together. Managed even-aged forests are characterized by a distribution of stands of varying ages (and, therefore, tree sizes) throughout the forest area. The difference in age between trees forming the main canopy level of a stand usually does not exceed 20 percent of the age of the stand at harvest rotation age. Regeneration in a particular stand is obtained during a short period at or near the time that a stand has reached the desired age or size for regeneration and is harvested. Clearcut, shelterwood, or seed tree cutting methods produce even-aged stands.

EXCELLENT RIPARIAN CONDITIONS - An extremely shady and brushy riparian condition with an abundance of tall overstory conifer trees and shorter hardwoods of alder, willow and aspen will be present, the site has the potential to produce conifer and/or hardwood species. Gentle bank slopes, high plant densities, thick root masses, embedded angular boulders and old logs characterize these areas. Channel scouring will be minimized with deposition replaced by mossy aquatic growth on assorted sizes of tightly packed rocks.

FAULT - A fracture or fracture zone along which there has been displacement of the sides relative to one another parallel to the fracture.

FAWNING AREAS - areas used regularly by female deer for fawning (and maintaining fawns for their first few days or weeks); optimum fawning habitat includes low shrubs or small trees under a tree overstory of about 50-percent closure, usually located on slopes of less than 15 percent where vegetation is succulent and plentiful in June and potable water is available within 183 meters (600 feet).

FINAL ENVIRONMENTAL IMPACT STATEMENT (FEIS) - The final version of the statement of environmental effects required for major Federal actions under Section 102 of the National Environmental Policy Act (NEPA). It is a revision of the Draft Environmental Impact Statement to include public and agency responses to the
draft. It is a formal document which must meet legal requirements and is the document used as a basis for judicial decisions concerning compliance with NEPA

FIRE HAZARD REDUCTION - The treatment of fuels and residues, which reduces the potential fire's rate of spread or intensity.

FIRE MANAGEMENT EFFECTIVENESS INDEX (FMEI) - A number derived by totaling the cost of a fire protection organization and fire suppression cost with the net value change and dividing that figure by 1000 acres.

FIREWOOD - Wood, either round, split or sawn, and burned primarily for heating purposes

FISCAL YEAR (FY) - October 1st to September 30th.

FLOODPLAIN - The lowland and relatively flat areas adjoining inland and coastal waters (including debris cones and flood prone areas of offshore islands) including, at a minimum, those areas subject to a one-percent or greater chance of flooding in any given year (100-year recurrence).

FORAGE (LIVESTOCK) - All grass and grass-like plants.

FORAGE (WILDLIFE) - All browse and herbacious food that is available to wildlife for grazing.

FORBS

1. Any herbaceous plant other than those in the Gramineae (true grasses), Cyperaceae (sedges) and Juncaceae (rushes) families - i.e., any nongrass-like plant having little or no woody material on it.

2. A palatable, broad-leaved, flowering herb whose stem (above ground) does not become woody and persistent

FOREGROUND - A term used in scenic management to describe the stand of trees immediately adjacent to a high-value scenic area, recreation facility, or forest highway. (See 'Background' or 'Middleground'.)

FOREST AND RANGELAND RENEWABLE RESOURCES PLANNING ACT OF 1974 (RPA) - An Act requiring the preparation of a program for the management of the National Forests' renewable resources and of Land and Resource Management Plans for units of the National Forest System. It also requires a continuing inventory of all forest, rangelands, and renewable resources nation-wide.

FOREST DEVELOPMENT ROADS (FDR) - Roads that are part of the Forest transportation system, which includes all existing and planned roads, as well as other special and terminal facilities designed as Forest development transportation facilities.

FOREST HEALTH - A condition where biotic and abiotic influences on the Forest (i.e. insects, diseases, atmospheric deposition, silvicultural treatments, harvesting practices) do not threaten management objectives either now or in the future.

FOREST INVENTORY PLAN - A plan, based on known cultural and environmental information, that delineates areas of varying degrees of suspected cultural resource potential.

FOREST PLAN - The National Forest Land and Resource Management Plan (Forest Plan) guides all natural resource management activities and establishes management standards and guidelines for the Forest. It describes resource management practices, levels of resource production and management, and the availability and suitability of lands for resource management. It is prepared under the implementing regulations and requirements of NFMA.

FORESTRY PROGRAM FOR OREGON (FPFO) - A comprehensive forest management program developed by the State of Oregon for all forest lands in the state regardless of ownership.
FOREST STANDARD - A performance criterion indicating acceptable norms or specifications that actions must meet to maintain the minimum conditions for a particular resource. This type of standard applies to all areas of the Forest regardless of the other management area direction applied.

FOREST SUPERVISOR - The official responsible for administering the National Forest System lands in a Forest Service administrative unit. He or she reports to the Regional Forester.

FORPLAN - The forest planning model. A linear programming software package used to analyze planning decisions regarding land use patterns, capital investment, and timber harvest scheduling.

FUEL BREAK - A strategically located strip of land, usually 100 to 500 feet wide, that has been altered by removal of flammable vegetation so that fires burning into it can be more readily extinguished.

FUELS - Anything within the Forest that will burn. Usually live and dead woody vegetation (e.g., grass, shrubs, trees).

FUEL TREATMENT - The rearrangement or disposal of fuels to reduce the fire hazard.

G

GEOMORPHIC - Of, or pertaining to, the form of the earth, or its solid surface features.

GEOTHERMAL - Of, or pertaining to, the heat of the earth's interior.

GOAL - A concise statement that describes a desired condition to be achieved sometime in the future. It is normally expressed in broad, general terms and is timeless in that it has no specific date by which it is to be completed. Goal statements form the principal basis from which objectives are developed.

GOODS AND SERVICES - The various outputs, including on-site uses, produced from forest and rangeland resources.

GRAZING - Consumption of range or pasture forage by animals.

GRAZING SEASON - 1. A period of grazing to obtain optimum use of the forage resource. 2. On public lands an established period for which grazing permits are issued.

GREEN DOT SYSTEM - A seasonal vehicular management program which visually indicates travel routes open to public use; roads not identified by the green dot, and cross-country travel, are closed to public use during the designated time period.

GROUND WATER - Water in a saturated zone of a geologic stratum.

GROUP SELECTION - A modification of the selection system in which trees are removed in small groups at a time.

GUIDELINE - An indication or outline of policy or conduct that is not a mandatory requirement (as opposed to a standard, which is mandatory).

H

HABITAT - The sum total of environmental conditions of a specific place occupied by a wildlife or plant species or a population of such species.

HABITAT CAPABILITY INDEX (HCI) - A process used to determine habitat capability for big game by evaluating thermal cover and road density.
HABITAT DIVERSITY INDEX - A number that indicates the relative degree of diversity in habitat forest wide.

HABITAT EFFECTIVENESS (HE) - A combination of both quantity and quality of habitat, including both natural and introduced factors, which produces a specific habitat condition that either limits or generates habitat use by a wildlife species.

HARVEST CUTTING METHOD - The combination of management practices used to manipulate forest vegetation resulting in forests of distinctive form and character. Harvest cutting methods are classified as even-aged and uneven-aged.

HEAP LEACH - A mineral extraction process in which a solution (commonly cyanide solution) percolates through a pile (heap) of ore, dissolving the metal being extracted. The solution is collected after it percolates through the heap, and the metal is recovered from the solution. This is a common extraction process for low-grade deposits of gold, copper and silver.

HERBACEOUS - Having little or no woody tissue and persisting usually for a single growing season.

HIGH CLEARANCE VEHICLES - Motorized vehicles that can drive over minor obstacles because of their elevated frame.

HISTORIC - Refers to the period of time for which there are written records (after European contact). In Region 6, the historic era begins at roughly 1800 A.D., with the first explorers who kept journals.

HYDROLOGIC - Pertaining to the quantity, quality, and timing of water yield from forested lands.

HYDROPHOBIC - Lacking affinity for water.

HYDROTHERMAL - An adjective applied to heated or hot aqueous-rich solutions, to the process in which they are concerned, and to the rocks, ore deposits, and alteration products produced by them.

IGNEOUS ROCK - Rock formed by the crystallization of once molten material called lava or magma.

IMPLAN - A Forest Service input-output model that is an economic model which predicts the behavior of an economy as certain portions of the economy are altered.

IMPROVED ROAD - A constructed or maintained vehicle way for the use of highway-type vehicles having more than two wheels.

INDICATOR SPECIES - A plant or animal species so highly adapted to a particular kind of environment that its mere presence is sufficient indication that specific conditions are also present. (W-W DEIS).

INTEGRATED PEST MANAGEMENT (IMP) - A process for selecting strategies to regulate forest pests in which all aspects of a pest-host system are studied and weighed. The information considered in selecting appropriate strategies includes the impact of the unregulated pest population on various resource values, alternative regulatory tactics and strategies, and benefit/cost estimates for these alternative strategies. Regulatory strategies are based on sound silvicultural practices and ecology of the pest-host system and consist of a combination of tactics such as timber stand improvement plus selective use of pesticides. A basic principle in the choice of strategy is that it be ecologically compatible or acceptable.

INTENSIVE FOREST MANAGEMENT - A high investment level of timber management that envisions initial harvest, regeneration with genetically improved stock, control of competing vegetation, fill-in planting, pre-commercial thinning as needed for stocking control, one or more commercial thinnings, and final harvest.

INTERDISCIPLINARY TEAM - A group of individuals with different training assembled to solve a problem or perform a task.
INTERMINGLED OWNERSHIPS - Lands within the National Forest boundaries or surrounded by National Forest lands that are owned by private interests or other government agencies. Because of early land grants, these lands frequently are in checkerboard ownership patterns.

INTERMITTENT SERVICE - A road developed and operated for periodic service and closed between periods of use.

INTERPRETATION - Educational activity which aims to reveal meaning and relationships of the natural and cultural environment through first-hand experience.

IRRETRIEVABLE - Applies to losses of production, harvest, or use of renewable natural resources. For example, some or all of the timber production from an area is irretrievably lost during the time an area is used as a winter sports site. If the use is changed, timber production can be resumed. The production lost is irretrievable, but the action is not irreversible.

IRREVERSIBLE - Applies primarily to the use of nonrenewable resources, such as minerals or cultural resources, or to those factors, such as soil productivity, that are renewable only over long periods. Irreversible also includes loss of future options.

ISSUE - A point, matter, or question of public discussion or interest to be addressed or decided through the planning process.

J

JASPEROID - Agate, jasper, or thundereggs.

K

KNUTSON - VANDENBERG ACT OF 1924 (K-V) - An act that allows for the use of receipts for National Forest timber to reforest, to conduct stand improvement work or to perform improvement projects for other resources on the area where timber was harvested.

L

LAND ALLOCATION - The decision to use land for various resource management objectives in order to best satisfy the planning process issues, concerns, and opportunities, and meet assigned forest output targets.

LAND EXCHANGE - The conveyance of non-Federal land or interest in the land to the United States in exchange for National Forest System land or interest in the land.

LANDLINE LOCATION - Location of Forest property boundaries.

LIFESTYLE - A characteristic way of living which may be an individual variant within the cultural mainstream or may be an individual expression of a subculture.

LEASEABLE MINERALS - Generally include minerals such as oil, gas, oil shale, coal, potassium, sodium, phosphates, sulphur, and geothermal.

LOCAL ROADS - Local roads are usually one-lane roads constructed to serve a dominant use or resource. Local roads do not access large land areas since they are more site specific than arterial and collector roads.

LOCATABLE MINERALS - These resources include gold, silver, lead, copper, and mercury, which are mined and processed for metals, and some uncommon nonmetallics.
LOGGING SYSTEMS -

Tractor Logging - A system of log transportation in which logs are pulled from the woods to a landing by means of a crawler tractor, skidder, or similar ground-based equipment.

High-Lead Logging - A system of cable logging in which the working lines are elevated at the landing area by a rigged wooden tree or portable steel spar.

Skyline Logging - A system of cable logging in which all or part of the weight of the logs is supported during yarding by a suspended cable.

Balloon Logging - A system of cable logging in which the weight of the logs is counteracted by the lift provided by a lighter-than-air balloon.

Helicopter Logging - A system of transporting logs from the woods to a landing as an external load on a helicopter.

LONG-TERM EFFECTS - Those effects which will be significant beyond the RPA planning horizon of 50 years

LONG-TERM SUSTAINED-YIELD TIMBER CAPACITY (LTSYC) - The highest uniform wood yield from lands being managed for timber production that may be sustained under a specified management intensity consistent with multiple-use objectives.

M

M - The Roman numeral for 1000.

MBF - One thousand board feet. Lumber or timber measurement.

MM - Million

MANAGED STAND - A stand of trees in which stocking level control is applied to achieve maximum growth

MANAGED YIELD TABLE - A table showing, for a given species (or species mix) on a given site, the progressive development of a managed stand at periodic intervals covering the greater part of its useful life. It usually includes average diameter, basal area, number of trees, standing volume, and harvest volumes for a specific timber management regime.

MANAGEMENT AREA (MA) - A unit of land allocated to emphasize a particular resource, based on the capability of the area.

MANAGEMENT CONCERN - An issue, problem, or a condition which constrains the range of management practices identified by the Forest Service in the planning process.

MANAGEMENT DIRECTION - A statement of multiple-use and other goals and objectives, the associated management prescriptions, and standards and guidelines for attaining them.

MANAGEMENT INDICATOR SPECIES (MIS) - A wildlife species whose presence in a certain location or situation at a given population level indicates a particular environmental condition. Population changes are believed to indicate effects of management activities on a number of other wildlife species.

MANAGEMENT INTENSITY - A management practice or combination of management practices and associated costs designed to obtain different levels of goods and services.

MANAGEMENT PRESCRIPTION - Management practices selected and scheduled for application on a specific area to attain multiple-use and other goals and objectives.
MANAGEMENT REQUIREMENT (MR) - Standards for resource protection, vegetation manipulation, silvicultural practices, even-aged management, riparian areas, soil and water and diversity, to be met in accomplishing National Forest System goals and objectives. (See 36 CFR 219 27)

MARGINAL COMPONENT - The portion of the commercial forest land on which it is presently not feasible (economically or technologically) to manage for timber crops but on which it may be possible in the future.

MASS-WASTING - A general term for a variety of processes by which large masses of earth material are moved by gravity either slowly or quickly from one place to another. (Dictionary of Geological Terms) Also mass movement.

MAXIMUM MODIFICATION - See *Scenic quality Objectives*

MEAN ANNUAL INCREMENT (MAI) - The total increment up to a given age divided by that age

MEMORANDUM OF AGREEMENT (MOA) - A three-party agreement (responsible Forest Service Official, State Historic Preservation Officer, Executive Director of the Advisory Council on Historic Preservation) which documents an agreed-upon plan to mitigate a proposed project's adverse effect upon cultural resources listed on or eligible for the National Register of Historic Places

METAMORPHIC ROCK - Rocks changed by heat and pressure causing recrystallization and loss of original characteristics.

MIDDLEGROUND - The visible terrain beyond the foreground where individual trees are still visible, but do not stand out distinctly from the stand. (See *Foreground* and *Background.* )

MINERAL DEVELOPMENT - The activities and facilities associated with extracting a proven mineral deposit

MINERAL ENTRY - Filing a mining claim on public land to obtain the right to any minerals it may contain.

MINERAL EXPLORATION - The search for valuable minerals on lands open to mineral entry.

MINERAL RESERVE - That portion of a mineral resource from which a mineral commodity can be economically and legally extracted.

MINERAL RESOURCE - A concentration of naturally occurring solid, liquid, or gaseous materials in or on the Earth's crust in such a form that economic extraction of a mineral resource is currently or potentially feasible (BLM Manual 3031).

MINIMUM VIABLE POPULATION (MVP) - The low end of the viable population range

MITIGATION - To moderate the force or intensity of environmental effects. To lessen or minimize an Adverse Effect upon a cultural resource listed on or eligible for the National Register of Historic Places. The two categories of mitigation most often used are project modification and data recovery.

MIXED CONIFER (MC) - A stand of coniferous trees with a mixture of species. Ponderosa pine will usually make up 25 percent to 75 percent of the species composition.

MODIFICATION - See *Scenic Quality Objectives."

MONITORING - A process of collecting significant data from defined sources to identify departures or deviations from expected plan outputs.

MOUNTAIN PINE BEETLE - A small insect (1/8 - 5/8 inch) that bores into the tree's cambium and deposits its eggs. Larvae emerge from the eggs and feed upon the cambial layer and thus disrupt the tree's translocation of food. Frequent attacks on the host tree result in the tree's mortality.
MORTALITY - The volume of sound wood dying from natural causes during a specified period.

MULTIPLE-AGED STANDS - An intermediate form of stand structure between even-/ and uneven-aged stands. These stands generally have two or three distinct tree canopy levels occurring within a single stand.

MULTIPLE USE - The management of all the various renewable surface resources of the National Forest System so that they are utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; that some lands will be used for less than all of the resources, and harmonious and coordinated management of the various resources, each with the other, without impairment of the productivity of the land, with consideration being given to the relative values of the various resources, and not necessarily the combination of uses that will give the greatest dollar return or the greatest unit output.

NATIONAL ENVIRONMENTAL POLICY ACT OF 1969 (NEPA) - An act declaring a National policy to encourage productive harmony between man and his environment, to promote efforts which will prevent or eliminate damage to the environment and the biosphere and stimulate the health and welfare of man, to enrich the understanding of the ecological systems and natural resources important to the Nation and to establish a Council on Environmental Quality.

NATIONAL FOREST FUND (NFF) - An account that includes all receipts (to the U.S. Treasury) from proclaimed National Forests for timber, grazing, land use, power, minerals, and user fees.

NATIONAL FOREST MANAGEMENT ACT (NFMA) - A law passed in 1976 that amends the Forest and Rangeland Renewable Resources Planning Act and requires the preparation of Forest plans.

NATIONAL FOREST SYSTEM (NFS) LAND - Federal lands that have been designated by Executive order or statute as National Forests, National Grasslands, or Purchase Units, and other lands under the administration of the Forest Service, including Experimental Areas and Bankhead-Jones Title III lands.

NATIONAL RECREATION TRAILS - Trails designated by the Secretary of the Interior or the Secretary of Agriculture as part of the national system of trails authorized by the National Trails System Act. National Recreation Trails provide a variety of outdoor recreation uses in or reasonably accessible to urban areas.

NATIONAL REGISTER OF HISTORIC PLACES - A register of cultural resources of national, state, or local significance, maintained by the Department of the Interior.

NATIONAL WILD AND SCENIC RIVER SYSTEM - Rivers with outstanding scenic, recreational, geological, fish and wildlife, historic, cultural, or other similar values designated by Congress under the Wild and Scenic Rivers Act for preservation of their free-flowing condition.

NET PUBLIC BENEFIT - An expression used to signify the overall long-term value to the Nation of all outputs and positive effects (benefits) less all associated inputs and negative effects (costs) whether they can be quantitatively valued or not. Net public benefits are measured by both quantitative and qualitative criteria rather than a single measure or index.

NO ACTION ALTERNATIVE (Alternative A) - The most likely condition expected to exist in the future if current management direction were to continue unchanged.

NONCOMMERCIAL SPECIES - Species that have no economic values at this time nor anticipated timber value within the near future.

NONDECLINING EVEN FLOW - A policy governing the volume of timber removed from a National Forest, which states that the volume planned for removal in each succeeding decade will equal or exceed that volume planned for removal in the previous decade.

GL - 15
NONFOREST LAND - Land that has never supported forests and lands formerly forested but now developed for such nonforest uses as crops, improved pasture, etc.

NONMARKET - (Noncash economic benefits) Products derived from National Forest resources that do not have a well-established market value, for example, wilderness, wildlife.

NONPRICED OUTPUTS - Outputs for which there is no available market transaction evidence and no reasonable basis for estimating a dollar value commensurate with the market values associated with the priced outputs.

NONSTRUCTURAL RANGE IMPROVEMENT - Practices and treatments undertaken to improve range not involving construction of improvements (e.g., seeding, fertilizing, or prescribed burning).

OBJECTIVE - A concise, time-specific statement of measurable planned results that respond to pre-established goals. An objective forms the basis for further planning to define the precise steps to be taken and the resources to be used in achieving identified goals.

OBLITERATE - The action needed to close an unneeded road and return the land to production.

OFF-HIGHWAY TRAVEL MANAGEMENT OBJECTIVES - These objectives relate to the recreation opportunities for off-highway use on areas and trails on National Forest lands. The objectives, which include off-highway travel criteria, are developed from management area direction and access management objectives.

OFF-ROAD or OFF-HIGHWAY VEHICLES (ORV's or OHV's) - Any vehicle, including ATV's, which is restricted by law from operating on public roads reserved for general motor vehicle traffic.

OLD GROWTH STAND - An old-growth stand is defined as any stand of trees 10 acres or greater generally containing the following characteristics: 1) stands contain mature and overmature trees in the overstory and are well into the mature growth stage; 2) stands will usually contain a multilayered canopy and trees of several age classes; 3) standing dead trees and down material are present; and 4) evidence of man’s activities may be present, but does not significantly alter the other characteristics and would be a subordinate factor in a description of such a stand.

OPERATION AND MAINTENANCE COSTS - Costs associated with operating and maintaining facilities, program management, and support costs associated with management of other resources.

ORE - A mineral deposit which can be extracted at a profit.

ORV CLOSURE - An administration order closing a land area to specified types of off-road vehicle travel yearlong.

ORV RESTRICTION - An administrative order restricting a land area to specified types of off-road vehicle travel during specific seasons or conditions.

OUTPUT - The goods, end products, or services that are purchased, consumed, or used directly by people. Goods, services, products, and concerns produced by activities that are measurable and capable of being used to determine the effectiveness of programs and activities in meeting objectives. A broad term for describing any result, product, or service that a process or activity actually produces.

OVERMATURE - The stage at which a tree declines in vigor and soundness, for example, height growth has usually stopped and probability of mortality is high.
OVERSTORY - The portion of trees in a forest which forms the upper most layer of foliage

OVERSTORY REMOVAL - A type of harvest which is designed to remove all of the trees in the overstory. The objective is to release the acceptably stocked understory.

OVERVIEW - A report, based primarily on archival research, that organizes and summarizes cultural resource information from a particular National Forest or geographic area.

PACIFIC NORTHWEST REGION - A Forest Service organizational unit consisting of all the National Forests in Oregon and Washington.

PARTIAL CUT - Any cutting other than a clearcut. This may include thinning, selection shelterwood or an overstory removal.

PARTIAL RETENTION - See "Scenic Quality Objectives."

PERMITTED GRAZING - Use of a National Forest range allotment under the terms of a grazing permit.

PERSONS-AT-ONE-TIME (PAOT) - The number of people in an area or using a facility at the same time. Generally used as "maximum PAOT" to indicate the capacity of an area or facility to support peak usage within established user density standards and without degradation to biophysical resources.

PHYSIOGRAPHIC - Pertaining to physical geography.

PHYSIOGRAPHIC PROVINCE - Region of similar structure and climate that has had a unified geomorphic cycle.

PLANNING HORIZON - The overall time period considered in the planning process that spans all activities covered in the analysis or plan and all future conditions and effects of proposed actions which would influence the planning decisions.

PLANNING PERIOD - Generally one decade. The time interval within the planning horizon that is used to show incremental changes to yields, costs, effects, and benefits.

PLANNING RECORDS - A system that records decisions and activities that result from the process of developing a forest plan, revision, or significant amendment.

PLANT ASSOCIATION - Climax plant community type.

PLANT COMMUNITIES - A homogeneous unit in respect to the number and relationship of plants in the tree, shrub, and ground cover strata.

POTENTIAL YIELD - The maximum, perpetual, sustained-yield harvest attainable through intensive forestry on regulated areas considering the productivity of the land, conventional logging technology, standard cultural treatments, and interrelationships with other resource uses and the environment.

PRECOMMERCIAL THINNING - The practice of removing some of the trees less than merchantable size from a stand so that the remaining trees will grow faster.

PREHISTORIC - Relating to the period of time before written records (prior to European contact). In Region 6, before 1800 A.D., or before the advent of written records.

PRESCRIBED BURNING - Use of fire in forest management for hazard reduction and vegetative manipulation.
PRESCRIBED FIRE - A wildland fire burning under specified conditions which will accomplish certain planned objectives. The fire may result from either planned or unplanned ignitions. Plans for use of unplanned ignitions for this purpose must be approved by the Regional Forester.

PRESENT NET VALUE (PNV) - The difference between the discounted value (benefits) of all outputs to which monetary values or established market prices are assigned and the total discounted costs of managing the planning area.

PRESERVATION - See “Scenic Quality Objectives.”

PRIMARY CAVITY EXCAVATOR - An animal that excavates a cavity in wood for nesting or roosting.

PRIME FARMLAND - All land which qualifies for rating as Class I or as Class II in the U.S. Soil Conservation Service land use capability classification.

PRIMITIVE ROADS - Roads constructed with no regard for grade control or designed drainage, sometimes by merely repeated driving over an area. These roads are single lane, usually with native surfacing and sometimes passable with 4-wheel drive vehicles only, especially in wet weather.

PROGRAMMED ALLOWABLE HARVEST - That part of the potential yield scheduled for harvest in a specific year. It is based on demand, funding, management needs and multiple use considerations and, as a consequence, may vary over time.

PUMICE - A volcanic glass full of cavities and very light in weight.

PYROCLASTIC ROCK - A rock consisting of unreworked solid material explosively or aerially ejected from a volcanic vent.

PUBLIC ISSUE - A subject or question of widespread public interest relating to management of National Forest System.

PUBLIC PARTICIPATION - Meetings, conferences, seminars, workshops, tours, written comments, responses to survey questionnaires, and similar activities designed and held to obtain comments from the public about Forest Service planning.

PURCHASER CREDIT - Credit earned by the purchaser of a National Forest timber sale by construction of contract-specified roads. Earned purchaser credit may be used by the purchaser as payment for National Forest timber removed.

RANGE ALLOTMENT - A designated area available for livestock grazing upon which a specified number, kind of livestock and season of use may be grazed under a term grazing permit. The basic land unit used to facilitate management of the range resource on National Forest System and associated lands administered by the Forest Service.

RANGE CONDITION - The state or health of the range vegetation and soil to produce a stable biotic community based on the composition, density, and vigor of the vegetation and the physical characteristics of the soil. Condition is expressed as satisfactory or unsatisfactory.

RANGE IMPROVEMENT - Any structure or nonstructural improvement to facilitate management of rangelands or livestock.

RANGELAND - Land where the vegetation is predominantly grasses, grass-like plants, forbs, or shrubs suitable for livestock grazing and browsing.
RANGE MANAGEMENT - The art and science of planning and directing range use to obtain sustained maximum animal production, consistent with perpetuation of the natural resource.

RANGER DISTRICT - Administrative subdivisions of the Forest supervised by a District Ranger who reports to the Forest Supervisor.

RARE II - See Roadless Area Review and Evaluation II.

REAL DOLLAR VALUE - A monetary value which compensates for the effects of inflation.

RECONSTRUCTION - Road or trail construction activities which take place on an existing road or trail and raise the standard of the road or trail. This can include relocation of the facility in a completely new location.

RECREATION CAPACITY - The number of people that can take advantage of the supply of a recreation opportunity during an established use period without substantially diminishing the quality of the recreation experience of the biophysical resources.

RECREATION INFORMATION MANAGEMENT (RIM) - A computer oriented system for the organization and management of information concerning recreation use, occupancy, and management of National Forest land.

RECREATION OPPORTUNITY SPECTRUM (ROS) - Land delineations that identify a variety of recreation experience opportunities categorized into six classes on a continuum from primitive to urban. Each class is defined in terms of the degree to which it satisfies certain recreation experience needs, based on the extent to which the natural environment has been modified, the type of facilities provided, the degree of outdoor skills needed to enjoy the area, and the relative density of recreation use. The six classes are:

1. **Primitive** - Area is characterized by an essentially unmodified natural environment of fairly large size. Interaction between users is very low and evidence of other users is minimal. The area is managed to be essentially free from evidence of human-induced restrictions and controls. Motorized use within the area is not permitted.

2. **Semiprimitive Nonmotorized (SPNM)** - Area is characterized by a predominantly natural or natural-appearing environment of moderate to large size. Interaction between users is low, but there is often evidence of other uses. The area is managed in such a way that minimum on-site controls and restrictions may be present, but would be subtle. Motorized recreation use is not permitted, but local roads used for other resource management activities may be present on a limited basis. Use of such roads is restricted to minimize impacts on recreational experience opportunities.

3. **Semiprimitive Motorized (SPM)** - Area is characterized by a predominantly natural or natural-appearing environment of moderate to large size. Concentration of users is low, but there is often evidence of other users. The area is managed in such a way that minimum on-site controls and restrictions may be present, but would be subtle. Motorized recreation use of local primitive or collector roads with predominantly natural surfaces and trails suitable for motor bikes is permitted.

4. **Roaded Natural (RN)** - Area is characterized by predominantly natural-appearing environments with moderate evidence of the sights and sounds of man. Such evidence usually harmonizes with the natural environment. Interaction between users may be moderate to high, with evidence of other users prevalent. Resource modification and utilization practices are evident, but harmonize with the natural environment. Conventional motorized use is allowed and incorporated into construction standards and design of facilities.

5. **Rural (R)** - Area is characterized by a natural environment that has been substantially modified by development of structures, vegetative manipulation, or pastoral agricultural development. Resource modification and utilization practices may be used to enhance specific recreation activities and to maintain vegetative cover and soil. Sights and sounds of humans are readily...
evident, and the interaction between users is often moderate to high. A considerable number of facilities are designed for use by a large number of people. Facilities are often provided for special activities. Moderate user densities are present away from developed sites. Facilities for intensified motorized use and parking are available.

6 Urban - Area is characterized by a substantially urbanized environment, although the background may have natural-appearing elements. Renewable resource modification and utilization practices are often used to enhance specific recreation activities. Vegetative cover is often exotic and manicured. Sights and sounds of humans are predominant on site. Large numbers of users can be expected both on site and in nearby areas. Facilities for highly intensified motor use and parking are available with forms of mass transit often available to carry people throughout the site.

RECREATION VISITOR DAY (RVD) - A measure of recreational use of an area. One recreation visitor day consists of 12 hours of recreation use of a site or area. Recreation visitor days are used as a recreation production or output capacity measure.

RECREATION WILDERNESS SPECTRUM (RWS) - This is associated with the recreation opportunity spectrum (ROS), a system used to classify or differentiate areas within wilderness to provide for a variety of management possibilities and wilderness opportunities. The objective of all classifications is to provide wilderness opportunities but to different degrees, from pristine to the semiprimitive transition.

REFORESTATION - The natural or artificial restocking of an area usually to produce timber and other wood products, but also to protect watersheds, prevent soil erosion, and improve wildlife, recreation and other natural resources. Natural reforestation includes site preparation to reduce competing vegetation and provide a mineral seed bed for seed provided by seed trees. Artificial reforestation is the planting of seedlings, cuttings or seeds by hand or mechanical means and may include site preparation.

REGENERATION CUT - The removal of trees intended for the purpose of assisting regeneration already present or to make regeneration of the stand possible.

REGION - The standard administrative unit of the Forest Service administered by a Regional Forester.

REGIONAL FORESTER - The official responsible for administering a single Region and preparing a Regional Guide.

REGIONAL GUIDE - The plan developed to meet the requirements of the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended, that guides all natural resource management activities and establishes management standards and guidelines for the National Forest System lands of a given region. It also disaggregates the RPA objectives assigned to the Region and to the Forest within that region.

REGULATIONS - Generally refers to the Code of Federal Regulations, Title 36, Chapter II, which covers management of the Forest Service.

REHABILITATION - Actions taken to protect or enhance site productivity, water quality, or other values for a short period of time.

RESEARCH NATURAL AREAS (RNA’s) - An area set aside by the Forest Service to preserve a representative sample of an ecological community; primarily for scientific and educational purposes. Commercial exploitation is not allowed and general public use is discouraged.

RESOURCE - An aspect of human environment which renders possible or facilitates the satisfaction of human wants and the attainment of social objectives.

RESOURCE VALUES - The tangible and intangible worth of forest resources.

RESPONSIBLE LINE OFFICER - The Forest Service employee who has the authority to select and/or carry out a specific planning action.
RESTORATION - The long-term placement of land back into its natural condition or state of productivity

RETENTION - A scenic quality objective which means human activities are not evident to the casual forest visitor.

REVEGETATION - The re-establishment and development of a plant cover. This may take place naturally through the reproductive processes of the existing flora or artificially through the direct action of man - reforestation or range reseeding.

RIGHT-OF-WAY - The right to pass through another person's land as obtained by condemnation or purchase

RIM - See Recreation Information Management.

RIPARIAN AREAS - The riparian ecosystem (area) is that land, next to water, where plants that are dependent on a perpetual source of water occur. Riparian sites include fluvial surfaces such as streambanks, active channel shelves, active floodplains, and overflow channels.

RIPRAP - A structure built of broken rock or other material used for protecting exposed soil from erosion along stream channels or road ditches.

ROAD DENSITY - The number of road miles per square mile of land area

ROADLESS AREA - An area of undeveloped Federal land within which there are no improved roads maintained for travel by means of motorized vehicles intended for highway use

ROADLESS AREA REVIEW AND EVALUATION (RARE II) - A comprehensive process directed by the Secretary of Agriculture to identify roadless and undeveloped land areas in the National Forest system and to determine their uses for either wilderness or other resource management and development and to determine areas that would require further planning to make such a decision.

ROADLESS ISLANDS - A roadless area that is surrounded by permanent waters, or that is markedly distinguished from surrounding lands by topographical or ecological factors such as precipices, canyons, thickets, or swamps.

ROAD MANAGEMENT OBJECTIVES - Road management objectives establish the intended purpose of an individual road based on management area direction and access management objectives. Road management objectives contain design criteria, operation criteria, and maintenance criteria

ROS - See Recreation Opportunity Spectrum.

ROTATION AGE - The age of a stand when regeneration harvest occurs.

RPA - Forest and Rangeland Renewable Resources Planning Act of 1974.

ROCKHOUND - An amateur rock and mineral collector.

RVD - See Recreation Visitor Day.

SALEABLE MINERALS - Saleable minerals include common varieties of sand, stone, gravel, pumice, pumicite, cinders, and clay. In general, these minerals are of widespread occurrence and are of relatively low unit value. They are generally used for construction materials and for road building purposes. Saleable minerals, which have some property giving them distinct and special value, remain locatable. Before a deposit can be sold, a determination of "common variety" must be made by minerals staff and legal counsel.
SALVAGE HARVEST - Removal of dead or dying trees resulting from insect and disease epidemics or wildfire.

SANITATION HARVEST - Removal of dead or dying trees to prevent spread of insects or disease

SAWTIMBER - Trees that will yield logs suitable in size and quality for the production of dimension lumber

SCENIC QUALITY OBJECTIVES - Categories of acceptable landscape alteration measured in degrees of deviation from the natural-appearing landscape

1. Preservation - Ecological change only.
2. Retention - Human activities are not evident to the casual Forest visitor.
3. Partial Retention - Human activity may be evident, but must remain subordinate to the characteristic landscape.
4. Modification - Human activity may dominate the characteristic landscape, but must, at the same time, follow naturally established form, line, color, and texture. It should appear as a natural occurrence when viewed in foreground or middleground.
5. Maximum Modification - Human activity may dominate the characteristic landscape, but should appear as a natural occurrence when viewed as background.

SCENIC RESOURCE - The composite of basic terrain, geologic features, water features, vegetative patterns, and land-use effects that typify a land unit and influence the visual appeal the unit may have for visitors.

SCOPING - Determination of the significant issues to be addressed in an EIS.

SEDIMENT - Solid material, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

SEDIMENTARY ROCK - A rock made up of sediment.

SEED CUT - Removal of mature trees near rotation age in a shelterwood harvest to permanently open the stand and prepare the site for regeneration from the seed trees left for that purpose.

SEEDLING/SAPLING - A forest successional stage in which trees less than five inches in diameter are the predominant vegetation.

SELECTION CUTTING - The annual or periodic removal of trees (particularly the mature), individually or in small groups from an uneven-aged forest to achieve the balance among diameter classes needed for sustained yields, and in order to realize the yield, and establish a new crop of irregular constitution. NOTE: The improvement of the Forest is a primary consideration.

SELECTION SYSTEM - A silviculture system in which trees in an uneven-aged stand are removed individually, here and there, from a large area each year in order to achieve a balance among diameter classes needed for sustained yield by selection cutting - ideally over a whole forest or working circle, but from practical considerations almost always over the annual coupes of cutting series, regeneration mainly natural and crop ideally all-aged.

SENSITIVE SPECIES - Plant or animal species which are susceptible or vulnerable to activity impacts or habitat alterations. Those species that are recognized by the Regional Forester as needing special management to prevent placement on Federal or State lists.

SERAL - A plant and animal community which is transitional in stage of succession, being either short- or long-term. If left alone, the seral stage will pass, and another plant and animal community will replace it.
SHELTERWOOD HARVEST - Silvicultural system used to harvest mature trees at rotation age in a series of preparatory, seed and removal cuts designed to regenerate a new even-aged crop under the shelter of the old crop.

SHORT-TERM EFFECTS - For timber management planning, those effects which will not be significant beyond the RPA planning horizon of 50 years; for DEQ water quality, short-term effects are defined as two days or less. Generally, short-term effects are within the planning period.

SIGNIFICANT - Meeting the criteria for inclusion on the National Register of Historic Places (same as eligible)

SILVICULTURAL SYSTEM - A management process whereby forests are tended, harvested, and replaced, resulting in a forest of distinctive form. Systems are classified according to the method of carrying out the fellings that remove the mature crop and provide for regeneration and according to the type of forest thereby produced.

SILVICULTURE - The science and art of growing and tending crops of forest trees to attain the desired level of marketable and unmarketable products

SITE INDEX - A measure of the relative productive capacity of an area for growing wood. Measurement of site index is based on height of the dominant trees in a stand at a given age

SITE PREPARATION - Removing unwanted vegetation and debris from a site and preparing the soil before reforestation.

SITE PRODUCTIVITY - Production capability of specific areas of land

SKYLINE LOGGING - A system of cable logging in which all or part of the weight of the logs is supported during yarding by a suspended cable.

SLASH - Debris left after logging, pruning, thinning, or brush cutting, and large accumulations of debris resulting from windstorms. It includes logs, bark, branches, and stumps

SMOLT HABITAT CAPABILITY INDEX (SHCI) - Smolt refers to the life history stage of anadromous salmonids in which physiological changes are taking place to adapt them for ocean survival and they are either migrating or will shortly migrate seaward. The three levels associated with this index are:

1. Existing SHC - The number of smolt being produced at the present time with existing escapement levels in existing freshwater habitat
2. Potential SHC - The number of smolt that are capable of being produced assuming there is sufficient adult escapement to fully seed existing freshwater habitat
3. Potential SHC with Full Enhancement - The number of smolt that are capable of being produced, assuming sufficient capital investments have been made to maximize the freshwater habitats and there is sufficient adult escapement to fully seed the existing and enhanced habitat

SNAG - A nonliving standing tree. The interior of the snag may be sound or rotted

SNAG LEVEL - The number of snags per unit of area by d.b.h. class selected as a management goal, the level is predicted on the theoretical number of snags per unit of area by diameter class needed to support nesting populations of woodpeckers at a selected density

SOCIOECONOMIC - Pertaining to, or signifying the combination or interaction of, social and economic factors.
SOIL EROSION - The detachment and movement of soil from the land surface by wind, water, or gravity.

SOIL COMPACTION - Increase in soil bulk density.

SOIL PRODUCTIVITY - The capacity of a soil, in its normal environment, to produce a specific plant or sequence of plants under a specific system of management.

SOIL RESOURCE INVENTORY (SRI) - An inventory of the soil resource based on landform, vegetative characteristics, soil characteristics, and management potentials.

SPECIAL COMPONENT - The portion of the commercial forest land that needs special treatment of the timber resource to achieve other resource objectives (e.g., old growth, streamside protection, or visual corridors).

SPECIAL USE PERMITS - Permits and granting of easements (excluding road permits and highway easements) authorizing the occupancy and use of land.

STAND - An aggregation of trees occupying a specific area and sufficiently uniform in composition, age arrangement, and condition as to be distinguishable from the forest in adjoining areas.

STANDARD - Performance criteria indicating acceptable norms or specifications that actions must meet. A principle requiring a specific level of attainment, a rule to measure against.

STANDARD COMPONENT - The portion of the commercial forest land on which crops of industrial wood can be grown and harvested with adequate protection of the forest resources under the usual provisions of the timber sale contract.

STATE HISTORIC PRESERVATION OFFICER (SHPO) - An official appointed by the Governor of each State to direct implementation of the National Historic Preservation Act of 1966 and subsequent regulations and Executive Order. Responsibilities include: State-wide cultural resource inventory, development of a State Historic Preservation Plan, review of National Register of Historic Places nominations, administration of Federal historic preservation grants, and review of Federal undertakings which might affect cultural resources listed on or eligible for the National Register of Historic Places.

STOCKING - The degree of occupancy of land by trees as measured by basal area or number of trees and as compared to a stocking standard; that is, the basal area or number of trees required to fully use the growth potential of the land.

STOCKING LEVEL CONTROL - The process of maintaining the desirable number of trees to achieve optimum growth and management.

STREAMFLOW - The discharge of water from a watershed that occurs in a natural stream channel.

STRUCTURAL RANGE IMPROVEMENT - Improvement requiring construction or installation to improve the range, facilitate management, or control distribution and movement of livestock.

SUITABILITY - The appropriateness of applying certain resource management practices to a particular area of land, as determined by an analysis of the economic and environmental consequences and the alternative uses foregone. A unit of land may be suitable for a variety of individual or combined management practices.

SUITABLE TIMBER LAND - Forested lands that are available for timber management because they have not been withdrawn because of Law or Regulation, where irreversible damage would not occur, and where regeneration can be assured.

SUMMER RANGE - A portion of the total range on which big game animals normally find food and cover during summer months.
SUNK FUNDS - Monies already invested.

SUPPRESSION - The action of extinguishing or confining a fire.

SUSTAINED YIELD - The achievement and maintenance in perpetuity of a periodic output of the renewable resources without impairment of the productivity of the land.

TARGETS - Objectives assigned to the Forest by the Regional Plan.

TECTONIC - Of, pertaining to, or designating the rock structure and external forms resulting from the deformation of the earth’s crust.

TEMPORARY ROADS - Temporary roads are low-level roads constructed for a single purpose and short-term use. Once use of the road has been completed, it is obliterated, and the land it occupied is returned to production.

THERMAL COVER - Cover used by animals to lessen the effects of weather; for elk the types of cover are:
    Summer Range - A stand of coniferous trees at least 40 feet tall with an average crown closure of 40 percent or more.
    Winter Range - A stand of coniferous trees 10 feet or more tall with an average crown closure of 40 percent or more.

THINNING - The practice of removing some of the trees in a stand so that the remaining trees will grow faster due to reduced competition for nutrients, water, and sunlight. Thinning may be done at two different stages:
    1. Commercial thinning - Removing trees that have reached sufficient size to be manufactured into a product.
    2. Precommercial thinning - Removing trees that are too small to make a merchantable product.

THREATENED SPECIES - Any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range and which has been designated in the Federal Register by the Secretary of the Interior as a threatened species.

THRESHOLD - The point or level of activity beyond which an undesirable set of responses begins to take place within a given resource system.

TIERING - Refers to the coverage of general matters in broad environmental impact statements (such as national program or policy statements) with subsequent narrower statements or environmental analyses (such as regional or basin wide program statements or ultimately site-specified statements), incorporating by reference the general discussions and concentrating solely on the issues specific to the statement in question.

TIMBER - A general term for the major woody growth of vegetation in a forest area.

TIMBER CLASSIFICATION - Forested land is classified under each of the land management alternatives according to how it relates to the management of the timber resource. The following are definitions of timber classifications used for this purpose.

1. Nonforest - Land that has never supported forests and land formerly forested where use for timber production is precluded by development or other uses.

2. Forest - Land at least 10-percent stocked (based on crown cover) by forest trees of any size, or formerly having had such tree cover and not currently developed for nonforest use.
3  **Suitable** - Land to be managed for timber production on a regulated basis

4.  **Unsuitable** - Forest land withdrawn from timber utilization by statute or administrative regulation (for example, wilderness), or identified as not appropriate for timber production in the Forest planning process.

5.  **Commercial Forest** - Forest land tentatively suitable for the production of continuous crops of timber and that has not been withdrawn

**TIMBER PRODUCTION** - The purposeful growing, tending, harvesting, and regeneration of regulated crops of trees to be cut into logs, bolts, or other round sections for industrial or consumer use. The term "timber production" does not include production of fuelwood.

**TIMBER SALE PROGRAM QUANTITY** - This includes all volume expected to be offered for sale. This includes "green" material, salvage, firewood and miscellaneous products. This is used to measure attainment of RPA budgeted target.

**TIMBER STAND IMPROVEMENT (TSI)** - Management activities conducted in an immature stand to accelerate diameter growth and improve the form of the trees that remain.

**TOLERANCE** - The ability of a tree to grow satisfactorily in the shade of, and in competition with, other trees.

**TONS OF SUSPENDED PARTICULATES** - A measure of the amount of solid material contributed to the airshed by smoke.

**TRAILHEAD** - The parking, signing, and other facilities available at the terminus of a trail.

**TRAIL VEHICLE** - Vehicles designed for trail use that are 40 inches wide or less, such as bicycles, snowmobiles, trail bikes, trail scooters, and all-terrain vehicles.

**TRANSITORY RANGE** - Land that is suitable for grazing use of a nonenduring or temporary nature over a period of time. For example, on particular disturbed lands, grass may remain in the area for a period of time before being replaced by trees or shrubs not suitable for forage.

**TRANSPORTATION SYSTEM** - All existing and planned roads and trails needed to access the Forest.

**TUFF** - A rock formed of compacted volcanic fragments, generally smaller than 4mm in diameter.

**UNDERSTORY VEGETATION** - Grass, small trees, shrubs, and other plants found beneath the overstory (the trees comprising the forest).

**UNEVEN-AGED MANAGEMENT** - The application of a combination of actions needed to simultaneously maintain continuous high-forest cover, recurring regeneration of desirable species, and the orderly growth and development of trees through a range of diameter or age classes to provide a sustained yield of forest products. Cutting is usually regulated by specifying the number or proportion of trees of particular sizes to retain within each area, thereby maintaining a planned distribution of size classes. Cutting methods that develop and maintain uneven-aged stands are single-tree selection and group selection.

**UNIT PLANS** - Land management plans prepared for multiple use management of land and resources on portions (units) of the National Forests, which do not necessarily fully incorporate NFMA requirements. "Units" do not always follow National Forest boundaries and, in some cases, include parts of two or more National Forests.

**UNPLANNED IGNITION** - A fire started at random by either natural or human causes, or a deliberate incendiary fire.
UNREGULATED - Timber land not managed on a sustained yield basis, such as administrative sites, campgrounds, and experimental forests.

UTILITY AND TRANSMISSION CORRIDOR - A strip of land designated for the transportation of energy, commodities, and communications by railroad, State highway, electrical power transmission (69 KV or above), oil and gas and coal slurry pipelines 10 inches in diameter and larger, and telecommunication cable and electronic sites for interstate use. Transportation of minor amounts of power for short distances, such as short feeder lines from small power projects including geothermal or wind, or to serve customer subservice substations along the line, are not to be treated within the Forest Plan effort.

UTILIZATION STANDARDS - Standards guiding the use and removal of timber, which is measured in terms of diameter at breast height (d b.h.), top diameter inside the bark (top d I b ), and percent *soundness* of the wood.

V

VIALBLE POPULATION - The number of individuals of a species required to ensure the long-term existence of the species in natural, self-sustaining populations adequately distributed throughout their region.

VIEWSHED - The total landscape seen or potentially seen from all or a logical part of a travel route, use area, or water body.

W

WATERSHED - The area that contributes water to a drainage or stream.

WETLANDS - Areas that are inundated by surface water or groundwater with a frequency sufficient to support, and under normal circumstances does or would support, a prevalence of vegetation or aquatic life that requires saturated or seasonally saturated soil conditions for growth and reproduction (Executive Order 11990).

WILD AND SCENIC RIVERS - Those rivers or sections of rivers designated as such by congressional actions under the 1968 Wild and Scenic Rivers Act, as wild, scenic, or recreational by an act of the Legislature of the State or States through which they flow. Wild and scenic rivers may be classified and administered under one or more of the following categories:

1. Wild River Areas - Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America

2. Scenic River Areas - Those rivers or sections of rivers that are free of impoundments, with watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads

3. Recreational River Areas - Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

WILDERNESS - Areas designated by congressional action under the 1964 Wilderness Act. Wilderness is defined as undeveloped Federal land retaining its primeval character and influence without permanent improvements or human habitation. Wilderness areas are protected and managed to preserve their natural conditions, which generally appear to have been affected primarily by the forces of nature, with the imprint of human activity substantially unnoticeable; have outstanding opportunities for solitude or for a primitive and confined type of recreation; include at least 5,000 acres or are of sufficient size to make practical their preservation, enjoyment, and use in an unimpaired condition; and may contain features of scientific, educational, scenic, or historical value as well as ecologic and geologic interest.
WILDERNESS ACT - Establishes a National Wilderness Preservation System to be composed of Federally-owned areas designated by Congress, administered for use and enjoyment as Wilderness, the preservation of their wilderness character, and for the gathering and dissemination of information regarding their use and enjoyment as Wilderness.

WILDERNESS RESOURCE SPECTRUM (WRS) - Classification used to further divide a wilderness into zones based on degrees of primitiveness. Areas of the Ochoco Wilderness will be managed under two classes of the WRS system:

1. **Primitive** - characterized by an essentially unmodified environment. Concentration of users is low and evidence of human use is minimal. The area is managed to be essentially free from evidence of human-induced restrictions and controls.

2. **Semiprimitive** - characterized by a predominately unmodified natural environment of moderate size. The concentration of users is low, but there is often evidence of other users. The area is managed in such a way that minimum on-site controls and restrictions may be present, but are subtle.

WILDFIRE - Any wildland fire that is not a prescribed fire. All wildfires require suppression.

WILDLIFE - All nondomesticated mammals, birds, reptiles, and amphibians living in a natural environment, including both game species and nongame species. Animals or their progeny, which once were domesticated but escaped captivity and are running wild (i.e., feral animals), such as horses, burros, and hogs, are not considered wildlife.

WILDLIFE AND FISH USER DAY (WFUD) - One WFUD consists of 12 hours of recreation that is the result of fish or wildlife.

WILDLIFE HABITAT DIVERSITY - The distribution and abundance of different plant and animal communities and species within a specific area.

WINTER RANGE - A range, usually at lower elevation, used by big game during the winter months; usually smaller and better-defined than summer ranges.

WITHDRAWAL - The withholding of an area of Federal land from settlement, sale, location, or entry, under some or all of the general land laws for the purpose of limiting activities under those laws in order to maintain other public values in the area.

WORKING GROUP - Comprises those parts of a forest that have generally the same growth potential and management opportunities.

YARDING - The moving of logs from the stump where cut to a central concentration area or landing.

ZONE OF INFLUENCE - The geographic area where most, but not all, of the direct social and economic effects of the Forest and Grassland’s management occur.

Land and Resource Management Plan

Part 2

Crooked River National Grassland

Caring for the Land...
Land and Resource Management Plan

Preface

Crooked River National Grassland

August 1989

The Crooked River National Forest Land and Resource Management Plan (Grassland Plan) was prepared in compliance with 36 CFR 219, based on the Forest and Rangeland Renewable Resources Planning Act (RPA) as amended by the National Forest Management Act of 1976, and in compliance with 40 CFR 1500 based on the National Environmental Policy Act of 1969.

Because the Plan is a major Federal action significantly affecting the quality of the human environment, an environmental impact statement (EIS) was prepared. The Plan provides direction for implementing the preferred alternative selected in the EIS.

If any particular provision of this Grassland Plan, or the application of the action to any person or circumstance, is found to be invalid, the remainder of the Forest Plan and the application of that provision to other persons or circumstances shall not be affected.

Additional information about the Plan is available from:

Chapter 1

Grassland Plan

Introduction
Chapter 1

Grassland Plan

Introduction

Purpose

The Land and Resource Management Plan guides natural resource management activities and establishes management standards and guidelines for the Crooked River National Grassland. It describes resource management practices, levels of resource production and management, and availability and suitability of lands for resource management.

National grasslands are a permanent part of the National Forest System, administered under the provisions and purposes of the Bankhead-Jones Farm Tenant Act (see Appendix G). The rules and regul-
lations applicable to national forests as set forth in
Title 36, Code of Federal Regulations, also apply to
national grasslands (see 36 CFR 213, Appendix C).

The Grassland Plan:

establishes Grassland-wide multiple use goals
and objectives;

establishes Grassland-wide standards and guide-
lines applying to future conditions;

establishes management area direction includ-
ing management area prescriptions and stan-
dards and guidelines applying to future manage-
ment activities in that management area; and

establishes monitoring and evaluation require-
ments.

The Grassland Plan embodies the provisions of the
National Forest Management Act of 1976, the im-
plementing regulations, and other guiding docu-
ments. Land use determinations, prescriptions, and
standards and guidelines constitute statements of
the plan’s management direction. However, the pro-
jected outputs, services, and rates of implementa-
tion are dependent on the annual budget.

This Plan will guide Forest Service programs on the
Crooked River National Grassland beginning in
fiscal year 1990 (Oct. 1, 1989). It will ordinarily be
revised on a ten-year cycle, but at least every 15
years. The Plan may be amended or revised at any
time if the Forest Supervisor determines that condi-
tions in the area covered by the Plan have changed
significantly, or if project level environmental analy-
sis demonstrates the need to make a change.

Relationship of the
Grassland Plan to Other
Documents

Relationship to the Environmental
Impact Statement and the Record
of Decision

This Grassland Plan sets forth the direction for man-
aging the land and resources of the Crooked River
National Grassland. The Plan results from extensive
analysis and considerations addressed in the Envi-
ronmental Impact Statement (EIS), and Record of
Decision (ROD). The planning process and the
analysis procedures used to develop these plans are
described in the EIS. The EIS also describes other
alternatives considered in the planning process.

Specific activities and projects will be planned and
implemented to carry out the direction in this Plan.
Environmental analysis will be performed on these
specific projects. This subsequent environmental
analysis will be tiered to the Plan and Environmental
Impact Statement.

Relationship to the Regional Guide

The Regional Guide for the Pacific Northwest Re-

goan, as amended December 8, 1988, provides direc-
tion for National Forest Plans, and in turn, can be
used also for National Grassland Plans. It includes
standards and guidelines addressing the major issues
and management concerns considered at the Re-

gional level, to facilitate planning.
Introduction

2. Regional Regional guide.
3. Forest National forest Land and Resources Management Plans (Forest Plans) for National Forest System lands. Tiered to Regional guide
4. Project Site or projects specific plans, generally at ranger district level. Tiered to Forest Plan.

Relationship to Special Area Plans
The Crooked River National Grassland includes several “special areas.” The plans for these include: Cove Palisades State Park Management Plan, Haystack Reservoir Recreation Management Plan, Rimrock Springs Wildlife Area Management Plan, and Gray Butte Electronic Site Plan. The regulations guiding the development of Forest Plans state that “if, in a particular case, special area authorities require the preparation of a separate special area plan, the direction in any such plan may be incorporated without modification in plans prepared under this subpart” (36 CFR 219.2(b)). Direction for incorporation and implementation of these plans can be found in Chapter 5, Implementation of the Grassland Plan.

Relationship to Other Plans
This Grassland Plan serves as the single land management plan for the Crooked River National Grassland. All other land management plans are replaced or superseded by the direction in this plan or will be made consistent with it; see Chapter 5 and the appendix for a listing of existing plans that this Grassland Plan supersedes.

Plan Structure

The Grassland Plan is composed of five chapters, a glossary, and appendices. Chapter 1 introduces the general purpose and structure of the Grassland Plan, explains how the plan relates to the environmental impact statement, and provides a brief description of the Grassland. Chapter 2 summarizes the supply and demand conditions for significant market and nonmarket goods and services on the Grassland. Chapter 3 discusses how the plan responds to the major issues identified during the planning process. Chapter 4 is the heart of the Grassland Plan. It sets the management direction for the Grassland for the next 10 to 15 years. It presents goals, objectives, and desired future conditions directing resource management on the Grassland. Desired future condition sections describe what the Grassland should look like after implementation of the management direction. Chapter 4 also presents prescriptions for each of the 16 management areas, Grassland-wide standards and guidelines, and management area standards and guidelines. Grassland-wide standards and guidelines state the constraints within which all practices are to be carried out in implementing the Grassland Plan.

Chapter 5 explains the methods for implementing the management direction, monitoring and evaluating implementation activities, and keeping the plan current in light of changing conditions or other findings. The Appendices provide the detailed and supplemental information needed to explain portions of the plan. An index is provided to assist readers in locating subjects of interest.
Grassland Description

The Crooked River National Grassland is located in central Oregon, entirely within Jefferson County (see Vicinity Map, Figure 1-1). Of 173,629 acres encompassed by the Grassland boundary, 111,379 acres (1987 figures) are under Forest Service administration. Other lands are privately owned or under the administration of the BLM, State of Oregon, or Jefferson County.

The Grassland is traversed north-to-south by State Highways 26 and 97. West of Highway 97, the country is a high plateau interrupted by the steep canyons of the Deschutes River and its tributaries. East of Highway 97, the terrain is rolling hills and buttes. Elevations range from 2,241 feet at Madras to 5,108 feet atop Gray Butte. Steep canyons border the major drainages, including the Deschutes and Crooked Rivers, and Squaw and Willow Creeks.

The Grassland lies within two subbasins of the Deschutes River drainage system: the Middle Deschutes River and Lower Crooked River.

It is believed that the Grassland was originally a grassland vegetated with bluebunch wheatgrass and Idaho fescue, and some sagebrush, rabbitbrush, bitterbrush and juniper. Because much of the area was cultivated and the native vegetation removed during the homesteading era, it is difficult to determine the original vegetation patterns.

The climate of the Grassland is typical for central Oregon. The annual precipitation averages 10.5 inches, but higher elevations may receive 19 inches or more per year. High intensity rainstorms are likely to occur during spring and summer months. The growing season averages 100 days. Temperatures are moderate throughout the year. Coldest temperatures are recorded in December and January; warmest temperatures are recorded in June, July, and August. Temperatures may fluctuate greatly between day and night, and frost can occur any day of the year. Humidity is usually low. (Hopkins and Kovalchik, 1983.)

The area was first homesteaded in the 1880's and eventually 700 homesteads were established. But by the 1930's, inadequate rainfall and poor economic conditions had caused the farms to fail and homesteaders to abandon their lands. By 1935, Federal Land Banks and private mortgage banks had taken over 35 percent of the homesteads in foreclosures. The Federal Government then began to buy the land back from the remaining homesteaders under the authority of the Resettlement Administration and Bankhead-Jones Farm Tenant Act.

Management of the land was transferred from the Soil Conservation Service to the Forest Service in 1954. Originally known as the Central Oregon Land Utilization Project, the name was changed to the Crooked River National Grassland in 1960. Management direction states that “the National Grassland shall be administered under sound and progressive principles of land conservation and multiple use.” (36 CFR 213).

During the late 1930's and early 1940's, many acres were seeded to provide ground cover and improve the bare ground situation that had resulted from plowing the land and attempting to raise grain. Treated lands (approximately 63,000 acres) were planted to either crested wheatgrass or beardless wheatgrass. The native bluebunch wheatgrass proved impossible to restore. In the 1960's, many acres were reseeded and sprayed with herbicides to control shrubs. In the 1970's, reseeding was phased out and fire was introduced as a management tool. This management method continues today.

The Crooked River National Grassland is administered as a Ranger District of the Ochoco National Forest and is the only National Grassland in the Forest Service Pacific Northwest Region (Region 6). There are 19 National Grasslands nationwide.

The Grassland is managed to promote the development of grassland agriculture and sustained yield management of the forage, fish and wildlife, timber, water, and recreation resources and to demonstrate sound and practical principles of land use. Since the beginning of the land utilization projects in the 1930's, improving range management and the forage resource has been a major goal.

Chapter 2

Summary of the Analysis of the Management Situation
Chapter 2

Summary of the Analysis of the Management Situation

Introduction

This chapter summarizes the supply and demand situation for the key market and nonmarket goods and services associated with the Grassland. Included is a summary containing:

- resource supply and demand conditions for the Resources Planning Act (RPA) periods,
- production levels attainable under both the current management direction (Alternative A) and the Grassland Plan;
- and a list of information that would be desirable to have prior to the preparation of the next Crooked River National Grassland Land and Resource Management Plan.

Resource and Economic Potentials

Benchmarks were developed to help define the resource and economic potentials of the Grassland, and the range of outputs from which alternatives could be developed.

Most of the benchmarks were developed to explore the potential of the Grassland to produce the maximum of a particular issue-related resource; e.g. range, recreation, or big game. Two benchmarks were developed to determine the mix of resources that produced the maximum present net value (PNV) of the Grassland - one using market values only and the other using market and assigned values. Market priced outputs include: minerals, livestock, grazing, and developed recreation. Outputs with assigned values are dispersed recreation, including and fish and wildlife use. (See Appendix B of the FEIS for dollar values)

One benchmark estimates the minimum costs to retain the Grassland in Federal ownership with no outputs of goods and services other than those that would occur incidentally, such as dispersed recreation.
While benchmarks must be realistic, they could not serve as alternatives because they do not address the issues, concerns, or opportunities (ICO's). Rather, they were used to define the minimum and maximum parameters within which alternatives might be developed.

All benchmarks and alternatives were required to meet management requirements (Regional Direction 1920, 11/10/83). The major Management Requirements (MR's) addressed are: soil and water conservation, and riparian areas.

Resource Description and Supply/Demand Projections for Selected Resources

Introduction

Following is a brief discussion of the current situation of each of the major Grassland resources (see FEIS Chapter 3 for more detailed discussions), and the anticipated supply and demand for goods and services associated with these resources. The supply figures were developed from the benchmarks and independent estimates. Demand figures were estimated independently and the source is included in Table 2-1. Economists consider “demand” to be a schedule of quantities of an output that users are willing to consume within a price range, at a given time, and under certain conditions of sale. The term “demand,” as used in this section, identifies a certain level of consumption at a particular point in time. Although demand estimates are projected over several decades, long-term projections are expected to be less accurate than those for the near future.

Forage

Current Situation:
The Grassland, through the Grazing Agreement with the Gray Butte Grazing Association, administers 20 grazing allotments under permit to 29 permittees. 21,252 annual unit months (AUM's) are permitted. The permittees have their base ranch operations in the three-county area of Jefferson, Deschutes, and Crook Counties. Due to the extended drought, animals have been sent home early over the last few seasons due to lack of forage. Actual use has been about 17,000 AUM's.

Supply:
The main limiting factor affecting the amount of utilizable forage by domestic livestock is the type of vegetation currently occupying the Grassland. Due to past agricultural and grazing practices and the exclusion of fire, many acres formerly occupied by bluebunch wheatgrass and Idaho fescue have been replaced by brush species and juniper.

With an intensive and aggressive program using prescribed fire and seeding, the supply of forage could be increased to support 29,000 AUM's.

Demand:
Ranchers regard the Grassland as desirable summer range because of the high quality of forage and easy access. As a result, allotments have been fully occupied for many years. When an allotment becomes available, it is usually filled, indicating a constant demand for available forage. In addition, there is interest in increasing livestock numbers and the season of use.

The demand figures in Table 2-1 are proportioned from the Forest Service 1980 RPA Program, and reflect the Grassland's apportioned share of the national demand for forage.
Fuelwood

Current Situation:
The Grassland provides about 300 cords of personal use fuelwood per year. Fuelwood from the Grassland is regarded as desirable by some due to the species (juniper), proximity to towns, and easy terrain.

Supply:
The Grassland has the potential to supply up to 12,500 cords of fuelwood per year. This level could significantly affect other resource objectives such as wildlife habitat.

Demand:
No demand projections are made. It is assumed that there is in fact some demand for fuelwood from the Grassland, but most use would be displaced onto the Forest if the Grassland was made unavailable for personal use fuelwood.

Minerals and Energy

Current Situation:
Oil, natural gas, diatomite, and cinnabar are the known or expected mineral and energy resources on the Grassland.

There are approximately 7,200 acres under lease for oil and gas, mostly located in the southeast quadrant of the Grassland near the old field headquarters. One well drilled in the 1960's was abandoned when it proved dry, and there was additional interest in drilling in the late 1970's. There are no geothermal leases on the Grassland.

Supply:
All of the Grassland is classified as available for and potentially favorable for the discovery of geothermal energy sources. All of the Grassland is available for oil and gas exploration and development, and approximately 66,000 acres are considered prospectively valuable.

About 22,000 acres are classified as having moderate potential for gold, silver, and mercury, and approximately 12,000 acres are classified as having moderate potential for diatomite. However, very little exploration has been done on the Grassland, and it is likely that further exploration will result in much of this land being reclassified as having low potential.

Demand:
The demand for oil, gas, gold, and mercury is directly related to international production and price. An increase in the price of any of these commodities will result in increased exploration on the Grassland, and the discovery of a valuable deposit may result in the production of the commodity. The largest number of acres ever leased for oil and gas on the Grassland was 17,000 acres in the early 1980's. There is no known demand for direct heat applications of geothermal energy on the Grassland. The demand for mineral materials is generated by the construction, reconstruction, and maintenance of roads on and near the Grassland. Approximately 250,000 cubic yards of mineral material will be produced on the Grassland each decade.

Recreation

Current Situation:
The Crooked River National Grassland is an untapped area that provides a variety of recreational opportunities. The local communities of Madras, Redmond, Culver, Prineville, and Bend, as well as those living in and adjacent to the Grassland have utilized this area for camping, fishing, hunting, pleasure driving, all-terrain vehicle (ATV) use, photography associated with old homesteads and canyon beauty, and organized group activities such as dog trials and horse endurance racing.

Roughly 100,000 recreation visitor days (RVD's) occur on the National Grassland, of which 90 percent is dispersed use. The area literally comes alive during the two weekends of deer hunting season, much of which is day hunting from local communi-
ties. This accounts for roughly 10 percent of dispersed use, and it is intense for a short period of time.

**Supply:**
Developed recreation capacity at Haystack Reservoir is not sufficient to handle the existing use when considering the area administered by the Bureau of Reclamation (BOR). The Grassland portion by itself can handle existing and projected use of the facility, but in consideration of all users of the reservoir and a cooperative effort to manage all users with the BOR, the facilities will need to be modified and expanded. The joint development management plan will guide the development of facilities on both the Grassland and BOR administered lands.

**Demand:**
Overall recreation demand is correlated with the population increase of approximately one percent per year. Demand for recreational vehicle camping, hiking, and interpretation is increasing at a higher rate than many other recreational activities. Hiking demand is highest in the semiprimitive natural setting. The latest information in the State-wide Comprehensive Outdoor Recreation Plan (SCORP) indicates that although more use actually occurs in roaded modified settings, the predominant preference is for primitive and semiprimitive nonmotorized settings. Demand for fishing in the Deschutes Canyon and general dispersed camping in the canyon bottoms are estimated to increase more rapidly as people become aware of this unique area.

**Social and Economic**

**Current Situation:**
The Grassland generated receipts primarily from grazing fees, special use permit fees, firewood sales, and mineral leases. Up to seventy percent of the gross grazing fees are retained by the Gray Butte Grazing Association for administrative costs and the Conservation Practices program. The remaining thirty percent of grazing fees is combined with all other receipts. Of this total, twenty-five percent goes to the county, and seventy-five percent goes to the U.S. Treasury. Currently Grassland supported jobs are a minor component of the local counties’ economic base.

**Supply:**
The ability of the Grassland to influence jobs and payment to counties is limited. Only the amount of livestock grazing and amount of acres leased for minerals have any impact.

**Demand:**
The demand for outputs which influence the economic parameters (displayed in Table 2-1) is expected to increase somewhat in the future.

**Wildlife and Fish**

**Current Situation:**
The Grassland provides habitat for approximately 200 species of birds, 80 species of reptiles, amphibians, and mammals, and 20 species of fish.

Key big game habitats include: mule deer winter range, and antelope winter range.

Riparian areas support the largest diversity of wildlife. Most of them have seen heavy impacts from livestock in the past. However, most of the structural work and management changes have been done to aid their restoration and they are on the road to recovery. Quail are a popular game bird that are present on the Grassland in limited numbers. It is expected that they will increase as the riparian habitat continues to improve and other habitat work is done.

Haystack Reservoir, Lake Billy Chinook, Deschutes River, Crooked River and Squaw Creek are the primary fish habitats on the Grassland and support a wide variety of warm water and cold water fish. Willow Creek also supports a fish population. Angling in Willow Creek has been closed by the Oregon Department of Fish and Wildlife. Fish numbers are being monitored and used as an indicator of riparian habitat recovery. Populations are increasing and

spreading in the creek as riparian conditions and resulting fish habitat are improved.

Many other species of wildlife make their homes in the great diversity of habitats available on the Grassland, some of which include: cavity nesting birds in the old growth juniper stands, raptors nesting on the cliffs of the Crooked and Deschutes Rivers, and the Ord's kangaroo rat in the sagebrush communities.

Supply:
The wintering deer population on the Grassland is estimated at 4,300. The habitat can support a larger population with an adjustment in cover/forage ratios which is planned to be done on the Grassland. However, intermingled private lands may be developed as homesites which will decrease overall habitat capability. It is estimated that by the third decade, wintering deer numbers will be 2,200, which will carry through the planning horizon of five decades.

The wintering antelope population on the Grassland is about 160 head. They are expected to increase up to a potential number of 350 head.

Demand:
The primary demand for wildlife on the Grassland is for populations of deer and antelope large enough to be hunted. Hunting license sales are expected to grow two percent annually between 1986 and 1995, and one percent annually thereafter.

Although the demand for hunting opportunities is expected to increase in the future, big game population levels are ultimately limited by the capacity of the environment to support them. Control through hunting is a means of regulating big game populations at levels compatible with their habitat capacity. The authority for establishing hunting seasons and regulating populations rests with the State.

Information Needs
This section lists the information, inventory, and research needs that have been identified for the Grassland. Gaps in data or scientific knowledge that would be desirable to fill prior to preparation of the next land and resource management plan are recognized. Organization and development of these needs is based on the biological, physical, and social ecosystems which are the foundation for the planning process.

This ecosystem perspective has been used to develop a comprehensive framework for identifying and organizing information, inventory, and research needs. This framework is intended to encourage integrated research approaches that address interdisciplinary needs rather than traditional functional approaches. The ecosystem approach should meet planning needs, as well as help the public understand information needs.

Of the many ecosystems found in wildlands, several were identified as having particular current importance in Grassland planning. Juniper old growth, riparian/aquatic, and upper slope ecosystems are examples of areas where more information would be desirable to test present planning assumptions as plans are implemented. Human visitors in the Grassland are an integral part of these ecosystems. People's needs and expectations concerning the Grassland should be considered in land and resource planning.

Information needed to address these concerns fall into six general categories: interactions and processes, long-term productivity, cumulative effects, management strategies and techniques, social and economic analysis, and wildland/community relations.

Interactions/Processes
This category includes information leading to a better understanding of interactions of ecosystems, and the physical, biological, social, and political processes that influence these ecosystems.
Clarify the relationships between recreational settings, use, and opportunities, and other resource uses.

Understand the relationships between old growth juniper characteristics and ecological and visual diversity, associated plant and wildlife species, and the maintenance of natural gene pools.

Determine the response of management indicator species to patterns of habitat created by management and natural succession.

Develop an understanding of ecosystem response to global atmospheric warming.

Evaluate the roles of disturbance processes in the maintenance and succession of natural systems.

Develop an understanding of atmospheric dispersion and deposition processes.

Determine the mechanisms of plant and animal dependence on fire.

Improve knowledge of the distribution and habitat requirements of wildlife associated with juniper old growth forests.

**Long-Term Productivity**

This section includes studies leading to a better understanding of ecosystem needs in order to maintain various aspects of long-term productivity.

Determine the effects of removing various levels of biomass on soil productivity.

Identify the current productivity levels of resources such as wildlife, forage, and fish habitat to establish baseline levels of productivity.

Establish baseline information on nutrient levels and distribution in soils and vegetation for major soil groups.

Assess the magnitude of change in vegetative growth rates in a carbon-enriched atmosphere.

Understand the role of fire in the nutrient cycles that maintain long-term productivity.

**Cumulative Effects**

This section includes studies to examine the cumulative effects of naturally occurring and human-induced activities on various aspects of selected ecosystems and resources.

Understand the cumulative effects of various management practices on resource outputs.

Identify the effects of changing habitat patterns on selected management indicator species.

Evaluate the effects of fire exclusion on the structure and function of ecosystems.

Determine the effects of human disturbance and livestock competition on wildlife species.

**Management Strategies and Techniques**

Assess the relationship of human presence in recreation areas and wilderness on habitat use by wildlife.

Assess the results of stream rehabilitation projects on fish population dynamics, public perception of landscape and recreation quality, stream quality, stream hydrology, etc.

Predict the changes in air quality that will result from alternative management strategies.

Evaluate decision processes that can compare market and nonmarket benefits.

Improve the efficacy of fire use for vegetation management and as an alternative to herbicide use.

Develop and refine monitoring techniques, including:

- Techniques used to assess habitat conditions and trends.
- Methods of assessing population density and reproductive success.
- Procedures for using habitat information to make inferences about populations.
Cost-effective sampling designs that provide information about both habitats and populations with appropriate reliability.

Review the utility of the ecological indicator species concept as a framework for wildlife planning, and investigate alternatives.

**Social and Economic Analysis**

Additional studies are needed to increase our understanding of the economic and social effects of many planned wildland activities.

Determine the costs and benefits of the grazing program to the local agricultural community.

Improve knowledge of mineral resource potential on the Grassland.

**Wildland-Community Relations**

The relations and interactions between wildlands and the human communities within and around them need to be better understood.

Understand the effects of prescribed fires on nearby communities.

Determine potential effects of increased human densities in and near national forests on recreational use, fire management, water quality, wildlife, cultural resource protection, etc., and develop strategies to respond to these relationships.
Chapter 3

Response to Issues, Concerns, and Opportunities
Chapter 3

Response to Issues, Concerns, and Opportunities

Overview

The Ochoco National Forest and Crooked River National Grassland initiated the public involvement process in 1980 to prepare for the Draft Plan and Environmental Impact Statement (EIS). There has been a major effort throughout the process to capture and incorporate public and agency ideas so that the Final Crooked River National Grassland Plan can be responsive to concerns and new information. This has been a continuing effort. The Plan is intended to be dynamic in its ability to respond to new ideas, issues or information as circumstances may require.

In the Draft Plan, National Grassland management and direction was overshadowed by the National Forest. In response to public comments, a separate plan was developed for the Grassland.

A discussion of the changes in issues from the Draft to the Final and how the Plan will address the issues follows.

Issue #1, Timber Supply and Forest Management, is not an issue on the Grassland. There is no programmed harvest of timber on the Grassland in this Plan.

Issue #2, Social and Economic Wants and Needs of Local Communities, continued to receive attention. Some comments noted the importance of grazing on local economies. These respondents expressed concern over the negative effect that reductions in grazing would have on Jefferson County.

As noted in the discussion under Issue #3, livestock grazing will increase over time. The local ranching community will continue to benefit from a dependable supply of forage.

Local communities are dependent on forest-related jobs and income, and payments to counties in lieu of taxes. As a result, economics is the major factor in measuring the social and economic effect the Plan will have on these communities.

Using computer models (described in FEIS Appendix B), the economic effects of the Plans for the first decade were estimated.

Income

Increase $1.737 million

Employment

Increase 124 jobs

Payments to counties, average annual

$4.9 million

Payments to counties will increase to $5.6 million in the second decade and then decrease to $5.4 million by the end of the fifth decade.

Issue #3, Livestock Grazing or Grazing Allotments, remained a major issue for the management of Grassland. In the public comments on the Draft, concern was expressed over the impact of grazing on riparian

Appendix A in the FEIS details how the issues were originally developed and how they evolved. The public comments on the DEIS, and the Forest responses to those comments are discussed in Appendix I of the FEIS. The comments received on the Draft Plan and EIS did result in changes in the final documents. A number of the issues were modified and new issues added.

These figures include the Ochoco National Forest.
areas and big game habitat. Many felt livestock grazing numbers could not be increased while simultaneously improving riparian conditions.

Spring, summer, and fall pasture will continue to be provided for livestock. The present supply of 17,000 AUM’s for livestock will continue to be provided through the first decade, increasing to 18,000 AUM’s in the second decade and 19,000 AUM’s in the third decade and after. Forage productivity will be increased through structural and nonstructural range improvements including seeding, burning, fencing, and development and maintenance of water sources. Special attention will be given to the needs of wintering wildlife in the deer and antelope winter range areas.

**Issue #4, Riparian Area Management**, received additional interest during the public comment period for the Draft. As noted in the discussion for Issue #3, concern was expressed over the proposed increases in grazing numbers and how this might prevent the Grassland from improving riparian conditions.

The goal is to bring all riparian on the Grassland into “excellent” condition. Approximately 90 percent of the riparian improvement work has been completed, and the remaining 10 percent will be completed in the first decade. However, it will take many years before all riparian areas have attained their full biological potential.

Specific practices will include more intensive management practices (e.g., exclusion, high intensity-short duration grazing, and riparian pastures) and range improvements (e.g., fences and water developments). Range allotment plans will include forage utilization levels needed to meet brush and hardwood protection or riparian improvement needs.

**Issue #5, Transportation System**, generated 1000 comments on the DEIS. Some commented that too many roads are constructed and that road standards are too high. These respondents expressed concern over the cost of road construction and maintenance.

Support was voiced for the physical closure of roads to protect water quality and sensitive areas. Both temporary and permanent road closures were recommended to protect wildlife habitat. This is different from the comments made at the first public meetings, which opposed the closure of areas to access by motorized equipment. This view was expressed in comments stressing the need for roads to provide recreational access for the elderly and handicapped.

A travel plan for the Forest will address road management concerns and will complement the objectives of the various management areas on the Forest and Grassland. Wildlife habitat effectiveness objectives will be partially met through road restrictions and closures. The number of miles of roads maintained open for public travel on the Forest will decrease nominally in the future as a result of these road restrictions and closures for big game habitat protection, erosion control, and public safety.

In the first decade 4 miles of road will be maintained for passenger car travel, and 446 miles will be maintained for high clearance vehicles. By the fifth decade, 4 miles will be maintained for passenger cars, and 305 miles for high clearance vehicles.

Roads will be closed to protect soil and water, prevent disturbance of big game, and limit investment loss. In the first decade, 15 miles of roads will be closed. In the fifth decade, 25 miles will be closed. Closures may be seasonal or year long.

**Issue #6, Big Game Habitat**, was second only to timber in the number of public comments on the draft. While most comments addressed elk, which do not occur on the Grassland, comments were also received regarding deer and antelope. The public supported the management of big game winter range and the management of road systems to attain habitat effectiveness.

Management areas have been established to provide for wintering deer and antelope. Winter range will be provided to support 350 antelope. Deer winter range will support 4300 head in the near future, then drop steadily as private lands are developed and winter range effectiveness decreases, leveling off at about 2200 head.
Issue #7, Roadless Areas and Wilderness Study Areas, generated the third highest number of comments on the DEIS. Some of these comments addressed Deschutes Canyon. There was strong sentiment for the retention of existing roadless areas by some, while others objected to the single-use designation as precluding other uses. Some respondents recommended that roadless area management reflect a compromise between natural values and commodity production.

None of the Deschutes Canyon-Steelhead Falls Wilderness Study Area is being recommended for wilderness designation at this time. The primary reason for this is that most of the land within the study area is open country with evidence of human use in the form of roads and structures. The area within the Deschutes and Squaw Creek canyons possessing more rugged scenic characteristics is too small to be effectively administered as a wilderness. In addition, parts of this area have been classified under the Wild and Scenic River Act, and will receive protection under that law. Details of this recommendation are included in Appendix C of the FEIS.

Squaw Creek and the area surrounding it will be managed for nonmotorized recreation and to protect its natural features. The Deschutes and Crooked Rivers will continue to be managed to protect their natural characteristics. Both have been added to the Wild and Scenic River System. Squaw Creek has had an eligibility determination made for Wild and Scenic River designation. (See FEIS Appendix H.)

Issue #8, Scenic or Visual Resources, continued to receive public interest, although only a few comments concerned the Grassland. Some comments supported increased emphasis on visual resources, while others supported less emphasis.

Power lines visually dominate the landscape in parts of the Grassland. Existing power line corridors have been identified. While additions may be made to existing corridors, no new corridors will be developed.

The Crooked River Recreation Management Area (720 acres), Deschutes River Scenic Corridor Management Area (650 acres), and the Lake Billy Chinook View Management Area (560 acres) will be managed to maintain scenic quality.

Issue #9, Old Growth Forest, generated over 1000 comments on the DEIS. Some respondents noted the need to retain some old growth juniper habitat.

For juniper old growth dependent species, 740 acres of habitat will be dedicated in addition to the stands of juniper that may exist at any time elsewhere on the Grassland.

Issue #10, Fuelwood Supply, also generated over 1000 comments on the DEIS. The comments supported the continuation of fuelwood supplies into the future.

This Plan will continue to make firewood available in a manner consistent with other resource objectives and environmental constraints. Approximately 400 cords will be available annually between 1990 and 2000.

Between 1984 and 1989, the annual demand for firewood on the Forest and Grassland has been less than 6,000 cords. Even coupled with the Forest's supply, it appears that demand will exceed supply.

Issue #11, Snag Dependent Wildlife - Cavity Nesters, is not an issue on the Grassland. Some suitable cavity nester habitat does occur in juniper old growth stands.

Issue #12, Winter Sports, is not an issue on the Grassland because the traditional winter recreation use that this issue deals with does not occur on the Grassland.

New Issues

Public involvement, including comments on the DEIS, has resulted in the Forest adding four new issues to the twelve developed for the DEIS. Two of the issues are extensions of previous issues where it became evident that special attention would be appropriate in the FEIS to capture public concerns and allow full assessment of the issue in the development, analysis and selection of a final alternative for the Forest and Grassland Plans.
**Anadromous Fish:** Anadromous fish is not an issue on the Grassland, because the Round Butte Dam prevents the fish from entering the rivers on the Grassland.

**Historic Trail Preservation - Summit Trail:** Because the Summit Trail does not cross the Grassland, this is not a Grassland issue.

**Off-Road Vehicle (ORV) Use:** This issue emerged during the issue/Final Plan validation phase. Most respondents desired a reduction in ORV use on the Grassland. Some favored a total ban on ORV's, while others felt use should be prohibited in sensitive areas. This issue is best described as a social issue. Off-road vehicle owners like to pursue fun through the use of their ORV. Others find ORV's offensive and oppose the use of them on the Grassland. Much of the distaste seems to surround the noise levels, the displacement of wildlife, trespass onto closed areas and private land and the impacts they make on scenery. Off-road vehicle users feel that the Grassland has enough nonmotorized opportunities, and that motorized recreation opportunities are lacking.

A managed system of trails for off-highway vehicles will be provided at the Trails Crossing (Henderson Flat) area and other designated trails identified on the Travel Plan Map.

**Round Mountain:** Because Round Mountain is on the National Forest, it is not a Grassland issue.
Chapter 4

Grassland Management
Direction

Section 1
Grassland Management Goals,
Objectives, and Desired
Future Condition
Chapter 4
Grassland Management Direction

Section 1

Grassland Management Goals, Objectives, and Desired Future Condition

Management goals provide broad direction for the management of the Grassland. Specific direction, based on the goals, is provided in the General Standards and Guidelines and Management Area Standards and Guidelines, Section 3.

Primary goals for the Grassland are:

Administer the National Grassland under sound and progressive principles of land conservation and multiple use, and promote the development of grassland agriculture and sustained-yield management of the forage, fish and wildlife, timber, water, and recreational resources.

Manage the National Grassland resources to maintain and improve soil and vegetative cover, demonstrate sound and practical principles of land use, and exert a favorable influence for securing sound land conservation practices on associated private lands.

Objectives represent projected outputs which are estimates of the levels of goods and services anticipated when the Plan is fully implemented. Table 4-1, p. 4-20, displays the expected outputs of key resources on the Grassland, expressed in terms of average annual outputs per decade for the next five decades. The outputs shown are projections developed by resource specialists based on available inventory data and assumptions, and are subject to the annual budget and other elements of uncertainty inherent in predicting future events.

Desired future conditions summarize the anticipated physical changes that are likely to occur as a result of carrying out planned management practices. These descriptions are provided at ten years, and fifty years and beyond for the Grassland.
The information presented in this section provides goals, objectives, and desired future conditions for the key Grassland resources. Resources are presented in alphabetical order. They are:

- AIR QUALITY
- BIOLOGICAL DIVERSITY
- CULTURAL RESOURCES
- FACILITIES
- FIRE
- FORAGE AND LIVESTOCK USE
- FUELWOOD
- LANDS
- MINERALS AND ENERGY
- OLD GROWTH JUNIPER
- RECREATION
- SCENIC RESOURCES
- SOCIAL AND ECONOMIC
- SOIL
- TRANSPORTATION SYSTEM
- WATER
- WILDLIFE AND FISH

**Air Quality**

**Goal(s)**

Maintain air quality at a level adequate for the protection and use of the Crooked River National Grassland resources, which meets or exceeds applicable Federal and State standards and regulations (Clean Air Act, as amended, and Oregon State Implementation Plan for Protection of Visibility in Class I Areas).

**Objectives**

Use the best available technology and management techniques to minimize smoke production from prescribed burning activities. Table 4-1, p. 4-20, shows the estimate of total suspended particulates (TSP) generated in smoke from both natural and activity residue treatments.
Desired Future Condition

In Ten Years
Air quality will be maintained or improved due to increasingly stringent State restrictions on burning. However, air quality will continue to be influenced by smoke and other pollutants produced outside the Grassland, e.g., local agricultural field burns, and slash treatment from neighboring forest lands.

Fifty Years and Beyond
Air quality should be much improved through a variety of regulatory and burning technologies. Much of the desired vegetation mosaic will be in place (more grass and forbs, less juniper and sage) which translates into fewer smoke emissions from the continuing maintenance burning envisioned.

Biological Diversity

Goal(s)
Maintain native, historic, and desirable introduced plant and animal species and communities, including those that may be threatened, endangered, or sensitive.
Maintain or enhance ecosystem functions to provide for long-term productivity of resources and biological communities.

Objectives
Provide for all seral stages of terrestrial and aquatic plant associations existing and/or desirable for the Grassland with a distribution that is ecologically sound, and ensure continued reproduction of the species. For the Crooked River National Grassland, the following diversity elements serve as objectives for defining biological diversity for both plants and animals. Values are displayed as totals, rather than as average annual outputs.

Desired Future Condition

In Ten Years
Biological diversity of plant and animal communities and species will be different in ten years.
Riparian areas, which serve as critical habitat for more than 75 percent of the Grassland’s wildlife species, will be improved over today’s conditions, as a result of specific management actions.

Dedicated old growth juniper areas will be providing a habitat niche that has shrunk as other areas have been managed for optimum deer habitat and livestock forage production.

All plant communities will be present as no planned activities are intensive to the point that they would result in a change from one plant community to another. Vegetation conditions will be improving on areas that are presently in less than good condition.

Fifty Years and Beyond
Riparian areas will all be in excellent condition and will contain a large variety of plant communities.

Dedicated old growth juniper areas will be providing a habitat niche that has shrunk as other areas have been managed for optimum deer habitat and livestock forage production.

All areas will be in good vegetative condition.

Cultural Resources

Goal(s)
Locate, evaluate, protect, and mitigate if necessary, significant historic and archaeological sites. Enhance selected sites for public enjoyment, education and interpretation. Conduct cultural resource planning and preservation with public involvement from American Indian Tribes, historical societies, local interest and professional groups. Promote opportunities for research, traditional Native American cultural practices, writing and photography.

Objectives
Complete “broad area” cultural resource inventories and documentation prior to ground-disturbing activities on the Grassland (e.g. range improvements, water developments, pipeline or powerline installations, or road construction projects). Identify Native American traditional food and religious use areas in Compliance with Public Law 95-341 (American Indian Religious Freedom Act) and the Treaty of 1855, with the assistance of the Warm Springs Confederated Tribes. Site enhancement and protection, and National Register nominations will be accomplished through the NEPA process and be funded by specific projects or the Regional cultural resource capital investment process.
Site Enhancement and Interpretation
A comprehensive interpretative plan for the Grassland and its historic, cultural, and prehistoric resources will be implemented. Selected sites and classes of sites (thematics) will be enhanced and interpreted. A minimum of four sites or thematic classes will be interpreted per decade, gradually increasing during the five decades. Local citizens, interest groups, American Indian Tribes, and professional organizations will be involved in both comprehensive planning and specific site enhancement and interpretation.

National Register Nomination
An integral part of recording sites will be the application of the eligibility criteria for inclusion in the National Register of Historic Places. Determinations of Eligibility and Nominations will be treated thematically where possible to facilitate the treatment of groups, classes and districts of similar cultural resource sites. For example, the history of the Grassland and its associated homestead sites will be examined for their potential as a historic district. A determination of effect will be made for all listed or eligible sites prior to the implementation of associated projects. Nominations will generally be done on thematic classes or districts of historic or prehistoric sites.

See Table 4-1, p.4-20, for outputs by decade for Cultural Resources.

Desired Future Condition
In Ten Years
The “Interim Cultural Resource Inventory Design” will have been implemented and 11,000 acres will have been surveyed. Sufficient inventory data will be available to modify the Inventory Design to conditions specific to the Grassland. Thematic Determinations of Eligibility for classes of historic and prehistoric sites will have been conducted. Management plans and allocations for site and thematic site classes will have been implemented through the NEPA process with public involvement by local citizens, interest groups, Indian Tribes, the State Historic Preservation Office and the Advisory Council on Historic Preservation. Traditional Native American use of sites and areas will be recognized and considered during land and resource management activities. Site enhancement and interpretation will have been performed on specific sites and thematic classes. Stabilization of threatened cultural resource sites will have been performed within or adjacent to existing public recreation and use areas.

Fifty Years and Beyond
Cultural resources will be managed as part of a state-wide strategy in coordination with the State Historic Preservation Office and other Federal and State agencies. Cultural resource surveys will have been completed on 25,000 acres (25 percent of the Grassland). The accumulated knowledge of historic, cultural
and prehistoric site types and implementation of management plans and allocation strategies for cultural resource will reduce the need to inventory certain portions of the Grassland. Enhancement and Interpretation will dominate the program. Local citizens, groups and professional organizations will be involved in site preservation and interpretation. Native Americans will make greater use of the Grassland for traditional food gathering and religious practices; they will be involved in the management and treatment of prehistoric sites and burials, and the Grassland in general.

**Facilities**

**Goal(s)**
Plan, construct, maintain, and manage Grassland facilities to provide maximum economy, investment protection, user safety, and resource protection.

**Objectives**
Facilities consists of administrative sites located on the Grassland. There are campgrounds, day use areas such as Rimrock Springs Wildlife Management Area, and the Grassland field headquarters. Table 4-1, p. 4-20, shows future facilities construction and improvements as total numbers by decade.

**Desired Future Condition**

**In Ten Years**
Grassland facilities will be attractive to users and reflect favorably on the Forest Service. Marginal facilities will have been removed or upgraded based on need and planned life expectancy. Historic values of the facilities at the Grassland field headquarters will be emphasized in the ongoing maintenance.

**In Fifty Years and Beyond**
No drastic changes in location or design of Grassland facilities are predicted, even though some changes may occur as a result of an aging population.

Any reconstruction work done at Grassland field headquarters will conform to historic construction type.
Fire

Goal(s)
Control wildfire aggressively, particularly in urban-Grassland interface areas, and in a cost-effective manner (minimize suppression cost plus loss).

Provide for the ecologically sound use of prescribed fire as a cost-effective management tool for achieving other resource management objectives.

Objectives
Wildfire Management
Provide a cost-efficient fire management organization as determined by the National Fire Management Analysis System. The Wildfire Effectiveness Index figures shown in Table 4-1, p. 4-20, represent average annual program cost plus wildfire loss per thousand acres protected.

Prescribed Burning
Reduce wildfire intensities to support a cost-efficient fire protection organization.

Emulate the natural role of fire in maintaining environmental diversity and site productivity, and in maintaining or improving wildlife and range habitat.

Table 4-1 provides estimates of average prescribed fire acres. It is anticipated that there may be large variations above and below these averages in any one year due to variations in available burning conditions, funding, and personnel.

Desired Future Condition
In Ten Years
The natural role of fire in the Grassland ecosystem will be emulated by a mix of prescribed fire, natural fire, and other management techniques.

Fifty Years and Beyond
The natural role of fire in the Grassland ecosystem will continue to be emulated by a fully integrated program of prescribed fire and other management techniques. Increasing values at risk on intermixed private lands will continue to increase the need for fuel hazard management at the interface with Grassland areas and continued cooperation with wildland/urban fire control agencies.
Forage and Livestock Use

Goal(s)
Provide forage for wildlife and domestic livestock in a manner consistent with other resource objectives and environmental constraints, while maintaining or improving ecological condition and plant community stability. Use livestock as a tool for improvement of vegetation, soils, and watersheds.

Objectives
Present permitted use by domestic livestock is 22,000 Animal Unit Months (AUM's). The average actual use by domestic livestock is 17,000 AUM's. The difference between permitted use and actual use is due to forage utilization standards being met before the end of the grazing season on many allotments, and livestock being removed from the Grassland prior to the completion of the permitted season.

By implementing more intensive livestock management systems and improving forage production by increasing the prescribed burning program, it is projected that actual use by livestock will increase to 18,000 AUM's per year during the first decade, and 19,000 AUM's per year during the second decade and thereafter. (See Table 4-1, p. 4-20.)

Desired Future Condition
In Ten Years
Forage conditions are intended to improve as allotment management plans and intensive management systems are implemented, and range improvements are constructed or reconstructed. Forage for domestic livestock, deer, and antelope will be improved on approximately 3,000 acres per year by burning or cutting juniper and burning sagebrush.

Fifty Years and Beyond
Forage conditions will have been improved to their full potential given other resource considerations. All allotment management plans will have been updated several times and intensive range management practices will have been in place for years. Few new range improvements will be required and the range improvement program will consist of reconstructing existing improvements as they wear out. New management techniques and practices will be implemented.

The number of grazing allotments will most likely decrease, but productivity will be up about 10 percent due to intensive management practices and improved forage conditions. Burning and cutting to control juniper, and burning to control sagebrush, will be ongoing range improvement practices involving about 3,000 acres per year.
Fuelwood

Goal(s)
Provide fuelwood for personal and commercial use in a manner consistent with other resource objectives and environmental constraints.

Objectives
Fuelwood will be provided as a side benefit of clearing juniper for wildlife habitat and forage enhancement practices. Current and expected output is about 400 cords per year. (See Table 4-1, p. 4-20.)

Desired Future Condition

In Ten Years
Fuelwood outputs will continue to be about 400 cords per year and it will be a byproduct of juniper removal for forage and wildlife habitat enhancement.

In Fifty Years and Beyond
Fuelwood outputs will continue to be about 400 cords per year but the material will be smaller as optimum cover/forage ratios are obtained and available material starts coming from re-treated areas.

Lands

Goal(s)
Permit special land uses that have been evaluated in relationship to land management objectives, are harmonious with other resource objectives and environmental considerations, and that are in the public interest.

Achieve a pattern of landownership that best supports resource goals, improves the efficiency of resource management, and demonstrates effective Grassland management.

Objectives
Issue and administer special use permits in a manner consistent with management area direction (See Table 4-1, p. 4-20, for special use outputs by decade.)
Desired Future Condition

In Ten Years
The demand for special use permits, both recreational and nonrecreational, will increase. There will be no new utility corridors, but additional lines may be added to existing corridors. The National Recreation Strategy will result in additional permits for recreational facilities and activities.

There will be some accomplishment toward land exchange goals. Research Natural Areas (RNA's) will be withdrawn from mineral entry. Property boundaries will be surveyed, marked, and posted. Encroachments will be eliminated. Rights-of-way for trail access will be acquired.

The lease agreement with the State for National Forest System lands within Cove Palisades State Park will be continued. Lands not needed for Grassland purposes within the Park may be traded to the State. The Island RNA will be retained in Grassland ownership.

Fifty Years and Beyond
The demand for special use permits will continue to increase. The number of transmission lines within existing utility corridors is expected to increase.

Moderate progress will have been made toward accomplishing the desired land ownership. All of the property boundaries will have been surveyed, marked, and posted to Forest Service standards and maintained regularly. Grassland ownership within the Cove State Park may have been transferred to the State. The power withdrawals in excess of existing reservoir pool requirements along the Crooked and Deschutes Rivers will have been revoked and authority transferred to the Grassland or State.

Minerals and Energy

Mineral potential is discussed in detail in Appendix I.

Goal(s)
Provide for and facilitate the exploration, development, and production of mineral resources on the Grassland in coordination with other resource objectives, environmental considerations, and mining and leasing laws.
Objectives

Oil and Gas
The Grassland will respond to demands for oil and gas leases. In 1980, 17,000 acres were under lease; 7,200 acres are presently (1989) under lease. On the Grassland, 93,000 acres (includes all ownerships) are classified as being potentially valuable for oil and gas. This is assumed to be the maximum acreage that might be leased. Domestic demand for oil and gas leasing is directly related to international production and prices. Increases in the cost of imported oil and increased turmoil in the Middle East can trigger increased domestic production. These factors may cause an increase in leasing on the Grassland sometime in the next five decades. Changes in the international situation, changes in technology, or the depletion of Grassland oil and gas deposits may then result in the decline in the acres leased.

Geothermal
The Oregon Department of Geology and Mineral Industries (DOGAMI) has classified the entire Grassland as “favorable for the discovery at shallow depth (less than 1,000 meters) of thermal water of sufficient temperature for direct heat applications.” However, approximately three-quarters of the state is given this classification, and DOGAMI states, “it is probable that only small areas of this region are truly underlaid by such thermal water.” For the purposes of this Plan, it is assumed that the geothermal exploration during the next five decades will be concentrated in those areas where it is now occurring, and the Grassland will not issue any geothermal leases.

Nonenergy Minerals
Approximately 22,000 acres are classified as having moderate potential for gold, silver, and mercury, and approximately 12,000 acres are classified as having moderate potential for diatomite. However, very little exploration has been done on the Grassland, and it is likely that further exploration will result in much of this land being reclassified as having low potential.

Common Variety Minerals
The aggregate mined on Grassland land is mostly used to surface State and county roads. The demand for this material is expected to remain constant over the next five decades. See Table 4-1, p. 4-20.

Desired Future Condition

In Ten Years
Mining activity is not expected to change from the present low level of activity unless a valuable deposit is discovered. If oil and gas shortages develop nationally, seismic exploration activities could occur on the Grassland. An overall materials source management plan will be developed and a comprehensive
development plan written for each active or proposed source. All sources will be rehabilitated when depleted or closed. Most common variety material is used for road maintenance or reconstruction by local government agencies, and the demand for common variety materials will remain the same.

Fifty Years and Beyond
Interest in oil and gas leasing and exploration is expected to increase. Common variety minerals sources will be developed and rehabilitated in accordance with a materials source management plan.

Old Growth Juniper

**Goal(s)**
Provide stands of old growth juniper on the Grassland for wildlife habitat, ecosystem diversity and aesthetic diversity.

**Objectives**
Manage the 15 designated old growth juniper stands spaced approximately five miles apart so that the unique habitat niches they provide will be available for the wildlife species that use them.

**Desired Future Condition**

**In Ten Years**
Designated old growth juniper sites will be providing habitat niches and diversity while other areas will have various percentages of the juniper treated for wildlife habitat and range improvement objectives.

**Fifty Years and Beyond**
Designated old growth juniper sites will be continuing to provide habitat niches and diversity.
Recreation

Goal(s)
Emphasize the National Recreation Strategy.
Provide for a variety of recreational experiences in grassland, high desert, canyon, and riparian environments in a manner consistent with other resource objectives and environmental constraints.
Protect unique natural and recreational features.

Objectives
Manage, improve, modernize, and expand developed recreation sites based on use and needs.
Provide for a wide variety of recreational opportunities.

Desired Future Condition
In Ten Years
A variety of recreational opportunities will be provided. Existing campgrounds and boat ramps will be maintained and additional camping and boating facilities will be constructed at Haystack Reservoir.
The special values associated with existing and potential Wild and Scenic Rivers will be protected and enhanced. Opportunities for semiprimitive nonmotorized recreation will be provided in the Deschutes Canyon and Squaw Creek areas. Trailheads will be developed; rights-of-way and lands will be acquired to provide better public access for this area.
Off-road vehicles (ORV’s) are expected to become increasingly popular. ORV use will be accommodated on designated routes on the Grassland. Staging areas, camp areas, and routes offering a variety of challenges will be identified on the Grassland.

Fifty Years and Beyond
Recreational use of all types is likely to increase, requiring new strategies for managing and distributing use.
Scenic Resources

**Goal(s)**
Participate in the “National Forest Scenic Byways” program, through nomination of special Grassland roads that exhibit exceptional qualities and meet national selection criteria.

Provide natural appearing scenery along major travel ways, at developed and dispersed recreation sites, and in management areas where recreation is emphasized.

Integrate visual quality management into all resource activities which have potential effects on scenery.

**Objectives**
Table 4-1, p. 4-20, lists the acres projected for scenic resources by Visual Quality Objective (VQO). See Standards and Guidelines, Section 3, this chapter, for listing of VQO's by Management Area.

**Desired Future Condition**
In Ten Years, Fifty Years and Beyond
Juniper areas will be a mosaic of juniper and openings as a result of wildlife cover and forage manipulations.

Powerlines and other above ground facilities will continue to dominate the landscape within the utility corridors.
Social and Economic

Goal(s)
Manage the Grassland to lend support to the social and economic viability of local communities, as well as to the Nation as a whole.

Provide equal opportunities to people regardless of race, color, creed, sex, marital status, age, handicap, religion, or national origin.

Maximize net public benefits (36 CFR 219.3).

Objectives
The Grassland will continue to generate receipts primarily from grazing fees, special use permit fees, firewood sales, and mineral leases. Up to seventy percent of the gross grazing fees are retained by the Gray Butte Grazing Association to cover administrative costs and the Conservation Practices program. The remaining thirty percent of grazing fees is combined with all other receipts. Of this total, twenty-five percent goes to the county and seventy-five percent goes to the U.S. Treasury. The county also receives an average of about $20,000 worth of mineral materials for roads per year at no cost.

Desired Future Conditions
In Ten Years
The management of Grassland resources will be accomplished in an economically efficient manner. Investments in resource management will take into account site productivity, product value and marginal rates of return. Resources with market value (e.g. special uses, minerals, and grazing) which contribute to county receipts and the local economy, will experience increasing competition with nonmarket resources, (e.g. unroaded recreation, wildlife habitat, and unspoiled scenery). Urban population values and demands for the latter values from the National Grassland will increasingly conflict with local utilitarian views and lifestyles. The Forest Service, caught in this conflicting dichotomy, will continue to seek a balance of use options, and to form public partnerships.

Fifty Years And Beyond
The dichotomy and competition for resources, and the purposes of the National Grassland, will be politically and legislatively addressed, and the questions of today resolved, although new issues will arise. Greater uniformity and clarity will exist in how publics view the National Grassland, its purpose, and its management. The present method of payment to counties, which encourages conflict, will be changed to something other than that requiring local governments to emphasize resource extraction from the National Grassland in order to maximize county receipts.
Soil

Goal(s)
Manage soil to maintain, restore, or improve its natural productive potential.

Objectives
Land disturbing management activities such as road-building, grazing, and certain recreational uses have a potential for dramatic decreases in soil productivity if not managed or mitigated correctly. The objective of the Crooked River National Grassland is to prevent or correct soil damage in all activity areas that result in productivity loss on lands dedicated to plant and water production. (See Table 4-1, p. 4-20.)

 Desired Future Condition
In Ten Years and Beyond
Soil productivity will be conserved; areas where productivity has been impaired will be rehabilitated through management activities.

Transportation System

Goal(s)
Plan, design, operate, and maintain a safe and economical transportation system that provides efficient access for the movement of people and materials involved in the use and protection of Grassland resources.

Objectives
The miles of road open and maintained on the Grassland will decline over time as the Forest Service assumes ownership of 78 miles of public usage roads, no longer maintains other public usage roads, and inactivates and revegetates roads identified as having no current or future use for resource management. Initially, 15 miles of development roads will be closed seasonally or yearlong, increasing to 25 miles by the fifth decade. Four miles of road will be maintained for passenger vehicles, while the remaining miles (446 miles initially, and 305 miles by the fifth decade) of development roads will be maintained only for high clearance vehicles.
Water

Desired Future Condition

In Ten Years
State highways and County roads will continue to provide the principal access to the Grassland. The Forest Service will assume ownership and management of over 78 miles of public usage roads while other public usage roads on the Grassland will no longer be maintained by the Forest Service. Approximately 50 miles of roads identified as having no current or future use for resource management will have been inactivated and revegetated. Fifteen miles of Grassland development roads will be closed seasonally or yearlong. Most of the other 450 miles of Grassland development roads will be maintained only for high clearance vehicles.

Fifty Years and Beyond
Some of the primary, high-use county roads providing access to the Grasslands will have improved surfaces. Roads totaling 181 miles will have been closed and revegetated, and 25 miles will be closed seasonally or yearlong - a 36 percent increase in seasonal and yearlong closures over existing conditions. The other 310 miles of roads will be open only to high clearance vehicles.

Goal(s)
Maintain or improve water quality, quantity, and timing of run-off.
Comply with the objectives of the “Clean Water Act” and Oregon State water quality standards.
Provide water of a consistently high quality to users and dependent resources.

Objectives
Maintenance or improvement of water quality will be achieved through proper management of riparian areas and uplands. See Table 4-1, p. 4-20, for acres of riparian improvement by decade.

Desired Future Condition

In Ten Years
Work to restore riparian areas will have been completed, but not all riparian areas will have had time to recover to full biological potential. Many streams that
presently flow only seasonally will flow year-round. The potential for overland flows and delivery of sediment to streams from upland areas will have been reduced by construction of structural improvements (namely fences to exclude livestock and the development of dispersed water sources) and adjustments in grazing systems. Water quality will be maintained or improved to meet state standards for temperature and turbidity.

In Fifty Years and Beyond
All riparian areas will be in excellent condition. Where the potential exists, stream channels will be narrow and deep with overhanging banks. Deciduous vegetation will shade 80 percent of the surface of perennial streams, lowering water temperatures and improving fish habitat. Fish populations will be ten or more times the present population due to excellent stream and riparian area conditions.

Wildlife and Fish

Goal(s)
Identify existing populations of any threatened, endangered, or sensitive species, and maintain or improve their habitats.

Provide, manage, and improve fish and wildlife habitats to maintain viable populations of existing native and desired non-native vertebrate species, including threatened, endangered, and sensitive species.

Objectives
Wintering Antelope Population
There are currently about 160 head of antelope wintering on the Grassland, considerably more than noted in the unit plan (1979), which predicted that antelope numbers would stabilize at 70 to 75 head. It is now believed that the wintering herd will continue to increase to a maximum of about 200 to 350 head, or to the point where neighboring private land damage complaints require the Oregon Department of Fish and Wildlife (ODFW) to limit further population growth. Antelope wintering habitat will be managed for the maximum number.

Wintering Deer Population
Deer populations are expected to remain at current levels in the near future, but drop dramatically in later decades as private land on the winter range is developed for homesites. The present deer population on the winter range is about
Wildlife and Fish

4,300. Habitat on the Grassland will continue to be improved to provide the optimum cover/forage ratios. However, at the same time, private land within and adjacent to the Grassland, that is also part of the winter range, is expected to be developed into home sites, reducing its ability to support deer. If the Grassland can acquire the private land, deer numbers may be maintained at the higher levels.

**Desired Future Condition**

**In Ten Years**

The wintering antelope population is expected to increase until it reaches the carrying capacity of the range at 200 to 350 head. The summering population is expected to remain at 40 to 50 animals.

Wintering deer populations are expected to remain at existing levels (in spite of development on private lands within the winter range) due to improved habitat on the Grassland. Habitat enhancement work will include: managing juniper to attain a 40 to 60 cover-to-forage ratio, prescribing fire applications on winter ranges, and improving riparian areas.

Populations of animal species, including upland game birds, doves, bluebirds and other songbirds, small mammals, reptiles, and amphibians, are expected to increase substantially as vegetation conditions in riparian areas and elsewhere improve, and as brush planted for winter cover and hiding cover matures.

Fish populations will increase dramatically as riparian areas improve in condition.

**Fifty Years and Beyond**

Antelope populations should be about the same on the Grassland summer range as they were after the first decade. Winter range numbers should also be about the same or less, depending on what happens on the summer ranges off the Grassland.

Deer populations are predicted to drop over the next 50 years. The Grassland portion of the winter range should be producing habitat at its potential due to habitat improvement work. Since a large portion is within private holdings, changes in the management of these lands are predicted, and natural succession will adversely affect the mule deer carrying capacity. Private land acquisition combined with habitat improvements should result in a fairly stable deer herd.

It is estimated that fish populations will be ten or more times the present population due to excellent stream and riparian area conditions.

Chapter 4

Grassland Management
Direction

Section 2
Management Area
Prescriptions
Chapter 4

Section 2

Management Area Prescriptions

A management area is composed of lands with similar capabilities managed under a common prescription. The lands may or may not be contiguous.

All areas of the Grassland are managed under the Grassland-wide standards and guidelines (Chapter 4, Section 3) and broader multiple use principles directed by laws, regulations, and policies.

Management area locations are displayed on the Alternative I Map (Figure 4-16, pg. 4-57). Individual maps for each management area are located at the end of this section of Chapter 4.

Modifying Management Areas or Prescriptions

The appropriate setting for each management area is determined by the management goals, objectives, desired conditions, and suitability of the area to achieve these conditions. When a project would result in conditions that do not meet these criterion, the need to modify the management area allocation should be addressed (see Chapter 5, Implementation of the Grassland Plan). Evaluation of factors including activity extent, duration of impact, season of operation, sight or sound impacts, or feasibility of rehabilitation would be necessary. Cumulative modifications of prescriptions should not exceed those described in Chapter 5, Implementation of the Grassland Plan, such modifications will be the exception, rather than the rule.

During implementation, it may be discovered that a management area boundary was inaccurately or inappropriately mapped. In such a case procedures for adjusting boundaries will also follow direction in Chapter 5, Implementation of the Grassland Plan (Amendment and Revision Process). Final boundary adjustments will be documented and integrated into the Grassland data base by the initiating party.

MA-G1 Antelope Winter Range

22,700 Acres

Description
The Antelope Winter Range Management Area is located between Prineville and Madras in the vicinity of Boyce Corral, the Grassland field headquarters and Scales Corral. This management area is generally open country with some scattered patches of juniper.

Emphasis
Manage for optimum winter range conditions for antelope in conjunction with the Oregon Department of Fish and Wildlife.

Desired Condition
The antelope winter range will generally consist of open grassland with shrub heights at or below 24 inches, but definitely not over 30 inches in height.

Fences will be built with lower wires elevated for easy passage by antelope.

The area will have an abundance of fall greenup left for antelope winter use.

MA-G2 Metolius Deer Winter Range

12,740 Acres

Description
The Metolius deer winter range is located in the lower desert area west of the Deschutes River on the National Grassland, the Sisters Ranger District of the Deschutes National Forest, and on private and BLM lands. Of the total acreage of the Metolius winter range, 12,740 acres are located on the National Grassland.

Present permitted grazing use of the winter range is by two bands of sheep and one cattle allotment.
Emphasis
Manage for big game winter range habitat.

Produce high quality deer winter range habitat to support Oregon Department of Fish and Wildlife management objectives for the wintering deer population. Manage for 60/40 forage/cover ratio and a healthy, vigorous shrub overstory.

Desired Condition
The forage/cover ratio will be at the optimum level of 60/40 wherever that is possible and will be well distributed. A vigorous shrub component will be present. Private land will either not be developed or will have been acquired by the National Grassland.

Livestock will be used as a management tool to maintain winter deer forage in a highly palatable and nutritious condition.

Roads will be managed to reduce harassment and stress on wildlife.
MA-G3 General Forage

59,440 Acres

Description
The General Forage Management Area consists of those parts of the Grassland not allocated to other management areas. It is located primarily in the east and north portions of the Grassland. This area consists of different combinations of juniper, sagebrush and bunchgrass communities.

Emphasis
Manage for forage production and utilization in a manner consistent with general standards and guidelines for other resources.

Desired Condition
The management area will contain the natural composition and cover values of native grasses, sedges, forbs and palatable shrubs. Undesirable forage plants, such as sagebrush and juniper, that decrease range productivity will be managed using the tools of fire and livestock to reduce their competition while keeping with multiple use of objectives. Proper stocking levels and distribution of livestock will be employed to effectively utilize forage production without adversely affecting plant communities over time.
Some crested wheatgrass pastures will be used as early season pastures, and as such will be managed to maintain the crested wheatgrass.

Other crested wheatgrass pastures will be proceeding through natural succession to re-establish native plant species.

Aspen clones will be regenerating and noxious weeds will be declining or absent.

Range improvements will be in place to facilitate livestock distribution and effective use of forage.

MA-G4 Research Natural Areas

110 Acres

Description

Two Research Natural Areas (RNA's) are located on the National Grassland: Haystack Butte and Island.

The Haystack Butte RNA is located on an isolated butte 11 miles south of Madras. The RNA is potentially 84 acres: 58 acres of National Grassland and 26 acres of private land.

The Island RNA, 215 acres (162 acres BLM and 53 acres National Grassland), is located on an isolated butte on the north end of the peninsula between the Deschutes and Crooked River arms of Lake Billy Chinook.
Each RNA represents several plant communities in the juniper/shrub/steppe zone as follows:

**Island**
(Flat)
1. Western juniper/big sagebrush/bluebunch wheatgrass-Idaho fescue
2. Western juniper/big sagebrush/bitterbrush/bluebunch wheatgrass-Idaho fescue

**Haystack Butte**
(Top)
1. Western juniper/big sagebrush/bluebunch wheatgrass-Idaho fescue
2. Western juniper/big sagebrush/bluebunch wheatgrass-Idaho fescue, biscuits
   (Steep north side slopes)
3. Western juniper/big sagebrush/bluebunch wheatgrass-Idaho fescue
   (Steep south side slopes)
4. Western juniper/big sagebrush-rock spirea/bluebunch wheatgrass- arrowleaf balsamroot

**Emphasis**
Allow natural processes to occur for research purposes and education. These processes will provide baselines against which other activities may be measured, sites for study of natural processes in undisturbed ecosystems, and gene pool preserves for both plant and animal species.

**Desired Condition**
Natural conditions will be observed. Any management activities within the RNA will be directed at maintaining the natural conditions of the area; these human-caused changes to the ecosystem will not be readily evident. Continuing baseline studies may be occasionally visible in terms of equipment, instruments, and related activities.

Fire occurrence will be evident where natural lightning and human-caused fire starts occur.

There is a high probability that grazing will not be evident, but this is still to be determined through the official designation (RNA) process.
MA-G5 Juniper Old Growth

740 Acres

Description
The Juniper Old Growth Management Area consists of selected juniper stands suitable for providing old growth habitat conditions for specific wildlife species. These stands do not meet the criteria defined in the Regional guide, FEIS, 1984. Selected stands are at least 40 acres, and distributed not more than five miles apart. Where suitable stands are not available, capable areas have been selected and will be managed to allow the stands to grow toward old growth habitat conditions. Fifteen stands have been selected on the Grassland.

Emphasis
Provide habitat for wildlife species that prefer a habitat niche provided in old growth juniper stands. The common flicker is the management indicator species.

Desired Condition
Stands will be at least 40 acres in size dispersed not more than five miles apart. Trees will be large with hollow centers, and have broad, irregular-shaped crowns or spike tops. Most of the large trees, both live and dead, will support lichen growth. Trees will contain cavities from either bole splits and/or limbs that have broken away from the tree bole. Some younger trees will be present along with various grasses, forbs, and shrubs. Major management activities and roads will generally not be evident. Fire occurrence will be evident where natural lightning and human-caused starts occur. Grazing by livestock, as well as by big game wildlife species will occur. Existing range improvements will be maintained and new improvements allowed if they are compatible with the primary objectives of the management area.
MA-G6 Crooked River Recreation Area

720 Acres

Description
The Crooked River Recreation Area includes a one-half mile wide corridor encompassing the Crooked River canyon between the southern Grassland boundary and Lake Billy Chinook. Of 9.3 miles of free-flowing river within the Grassland boundary, 4.1 miles are in private ownership, 3.2 miles are administered by the Bureau of Land Management, and 2.0 miles are administered by the Forest Service. Private lands, both housing developments and farms, are included in the corridor along the canyon rim.

The canyon is rocky and steep and offers spectacular views from the rim. There are numerous natural and geologic features such as springs, rock pillars and columns, eagle nest rocks, waterfalls, and rapids along the river. The canyon becomes deeper as the river flows northward.

The Crooked River has been designated by Congress under the Omnibus Oregon Wild and Scenic Rivers Bill to be an addition to the National Wild and Scenic River System as a recreational river. The BLM is the lead agency for developing a management plan for the river.

Emphasis
Management will maintain the appearance of a natural landscape to enhance and protect recreational and scenic values. Further planning for this management area will be forthcoming, as required by the Omnibus Oregon Wild and Scenic Rivers Act of 1988.

Desired Condition
This steep canyon will remain relatively pristine, but evidence of ranching and subdivision housing will be observable along the canyon rim. The river will remain free flowing, and accessible (to some extent) to the rim only.

Access up and down the river will remain very difficult by foot due to cliffs, talus slides, and vegetative thickets. Canoeing, rafting, and kayaking will continue at low to moderate levels.
MA-G7 Deschutes River Scenic Corridor

650 Acres

Description

The Deschutes River Scenic Corridor includes a one-half mile wide corridor encompassing the Deschutes River canyon between the southern Grassland boundary and Lake Billy Chinook. Of a total of 3,087 acres, 2,076 acres are administered by the Bureau of Land Management and 655 acres are administered by the National Grassland. Private lands, both housing developments and farms, are included in the corridor along the canyon rim.

The canyon is rocky and steep; it offers spectacular views, such as the Geneva Overlook on the west rim where one can view 735 feet down the canyon to the river. There are numerous natural and geologic features such as the weeping wall springs, rock pillars and columns, eagle nest rocks, and waterfalls and rapids along the river. The canyon becomes deeper as the river flows northward.

This section of the Deschutes River has been designated by Congress under the Omnibus Oregon Wild and Scenic Rivers Bill for addition to the National Wild and Scenic River System as a scenic corridor. The BLM is the lead agency for developing a management plan for the river.
Emphasis
Manage for scenic quality and natural appearance of the landscape.

Desired Condition
This area will remain pristine and the river will remain free flowing. Access in the corridor will be over user-maintained trails offering opportunities to explore more primitive canyon experiences. Motor vehicle access in the corridor will be limited to existing routes within the Crooked River Ranch subdivision including access to the BLM Steelhead Falls area. Except for existing minor intrusions from private lands (houses on the rim at Crooked River Ranch and the pump house on the west side) the area will appear natural and rugged.

MA-G8 Squaw Creek
7,840 Acres, 6,470 acres in semiprimitive recreation and 1,370 acres in proposed "scenic river."

Description
Located in the southwestern corner of the Grassland, the Squaw Creek Management Area includes the sage and juniper plateaus surrounding the narrow canyon formed by Squaw Creek. Squaw Creek itself, a tributary of the Deschutes River, is an oasis in this otherwise dry land. The occasional ponderosa pine and
abundant riparian vegetation growing along the stream contrasts with the surrounding desert vegetation; the canyon walls offer interesting geologic formations and color. The main access to the area is provided by Forest Road 6360, which divides the area from east-to-west. The area where Road 6360 fords Squaw Creek is a popular area for dispersed camping.

A 7.5 river mile (creek) segment, one-half mile wide, from the Grassland boundary to its confluence with the Deschutes River, has been identified as suitable for recommendation as a "scenic river" under the Wild and Scenic River System. This river segment includes portions of two parcels of private land which are undeveloped except for improved road access to the canyon rim.

**Emphasis**

Provide opportunities for semiprimitive nonmotorized recreation in a pristine canyon setting, while protecting and enhancing the deer winter range habitat and fisheries. A 1,370-acre corridor along the creek will be managed for its scenic quality as a "scenic river."

**Desired Condition**

**Semiprimitive Nonmotorized Recreation**

Except for the one access of Forest Road 6360, which fords Squaw Creek at a dispersed campsite, the area will be void of motor vehicles. It will offer unique canyon hiking, bird watching, and fishing opportunities. User trails will continue to be the main access into the canyon areas. The vegetation will continue to be lush along the creek, providing excellent riparian habitat.

Recreational use and livestock grazing will occur, but the area will appear natural. Wildlife and fish species indigenous to the area will continue to exist at levels consistent with the available habitat. Fire occurrence will be evident where prescribed fire and wildfire from natural and human-caused starts occur.

**Proposed Scenic River Corridor**

Preserve the natural and scenic qualities of the river (creek) corridor. The canyon area within this corridor will remain pristine and offer remote recreational opportunities. Livestock grazing will not be allowed in the river corridor.
MA-G9 Riparian

**Description**
Riparian zones include land adjacent to water, and are identified by the presence of terrestrial vegetation that requires or tolerates large amounts of free or unbound water. These sites include wet areas around springs and seeps as well as streambanks and active floodplains. Major riparian areas include: Willow Creek, Mud Springs Creek, Squaw Creek, Deschutes River, Crooked River, and Lone Pine, Skull Hollow, Windom, Rodman and Lithgo drainages.

**Emphasis**
Maintain riparian habitat, including streambank stability and fish habitat capability, at existing levels where the desired condition is met. On sites where the desired condition is not met, take steps necessary to bring riparian condition to its ecological potential. Activities that will result in a deterioration of water quality in perennial and fish bearing streams will not be allowed. Range allotment plans will reflect forage utilization levels necessary to meet brush and hardwood protection or enhancement needs.

**Desired Condition**
Riparian areas will exhibit a low, but apparent levels of management. Vegetation may or may not appear manipulated, depending on the condition of the stream. An abundance of wildlife species should be evident as a result of restrictions on management activities and level of habitat provided. Due to management restrictions and the low risk associated with these areas, the signs of natural or man-caused fire will be infrequent.

For management purposes, a special protection area (100 feet from the edge of perennial bodies of water) will be apparent.

Roads not planned for future use, through and across riparian areas, will be obliterated and re-vegetated to a natural or near natural condition.

Within the limits of ecological potential, a shady, brushy condition with a canopy of alder, willow, aspen, or other deciduous vegetation will exist.

Where coniferous evergreens are a natural component of the ecosystem, a variety of size classes will exist to perpetuate the supply of shade and woody debris over time. Sites unable to support a canopy of deciduous or evergreen species will be characterized by vigorous stands of forbs, grasses, and grass-like riparian species.
Bank slopes containing high plant densities, thick root masses, embedded angular boulders, and old logs will also characterize these areas. Extensive scouring of streambanks will be an uncommon occurrence as will soil deposition outside the norm for the individual stream system. Streambeds will be commonly covered by native aquatic growth on assorted sizes of rocks and boulders.

Where cobble and gravel bars are prominent, they will become covered by sandy loam soils as riparian vegetation filters and traps stream sediments. As stream banks are re-built and cutbanks stabilized, a narrower, deeper channel will gradually develop.

MA-G10 Rimrock Springs Wildlife Area

430 Acres

Description
Rimrock Springs is a state-designated wildlife management area located 17 miles north of Prineville and 10 miles south of Madras on Highway 26 near the old Grassland field headquarters. The 450-acre area includes ponds and marshes that were developed cooperatively with the State (see Appendix J) and private groups. A short loop trail provides access to two wildlife viewing platforms. The old field headquarters and winter pastures for government horses are also included in the management area.

Emphasis
Provide unique habitat (wetlands, ponds, springs) within the juniper-sagebrush steppe characteristic of central Oregon’s high desert. Provide for nonconsumptive (viewing, photography) wildlife uses in a natural setting. Improve present habitat conditions and promote habitat diversity.

Desired Condition
Wildlife will be available for viewing and photography. A barrier-free (handicapped access) interpretive trail and a brochure will be used by the general public and as an outdoor education tool for schools. Barrier-free toilet facilities will be available at the trailhead. Interpretation of unique cultural resources will preserve early history of the area. Prescribed fire will be used to improve habitat.
MA-G11 Haystack Reservoir

150 Acres

Description

Haystack Reservoir, located in the southcentral portion of the Grassland between Highways 26 and 97, is an irrigation regulating reservoir developed by the Bureau of Reclamation (BOR) and operated by the North Unit Irrigation District. The reservoir has a capacity of 6,000 acre feet of water and surface area of 233 acres. The Haystack Reservoir Management Area includes the shoreline around the lake that is in public ownership.

Haystack Reservoir is a popular location for fishing, swimming, water skiing and other types of water-oriented recreation. Picnicking, sightseeing, and bird watching are also popular activities. Boat launching, camping, and picnicking facilities developed and operated by the Forest Service are located on the east shore of the reservoir (Haystack Lake Campground).

Under the guidance of a recreation management plan developed in 1986 (see Appendix L), work is under way through a partnership with the BOR, State Marine Board, and the Forest Service to develop the south, west, and north shores of the reservoir (BOR land) to provide a variety of additional boating, camping, and picnicking facilities. These facilities will be managed by the Forest Service. Other partnerships include cooperation with the Oregon Department of Fish and Wildlife and adjacent land owners who participate in cooperative wildlife and fisheries projects related to the reservoir and adjacent lands. The southeast corner of the lake has been set aside as wildlife habitat.
Emphasis
Provide a system of quality facilities that are safe and environmentally sound. Continue to emphasize camping, picnicking, boating, fishing, and swimming.

Desired Condition
Partnerships will help provide for the needs of recreational users. Bureau of Reclamation (BOR) lands around the reservoir will have been acquired by the Grassland to simplify management of the area (BOR would retain ownership and management of the dam). New and upgraded facilities will provide for barrier-free opportunities.

MA-G12 Cove Palisades State Park

2690 Acres

Description
Cove Palisades State Park is a developed recreation complex, including campgrounds, boat ramps, swimming beaches, and picnic grounds. It is located on the Deschutes and Crooked River arms of Lake Billy Chinook within the boundaries of the Crooked River National Grassland.

Land ownership within the park is a mix of State and Federal lands totaling 7,000 acres, as follows:

<table>
<thead>
<tr>
<th>Ownership</th>
<th>Acres</th>
</tr>
</thead>
<tbody>
<tr>
<td>State land</td>
<td>1,434</td>
</tr>
<tr>
<td>Leased from USDA (National Grassland)</td>
<td>2,695</td>
</tr>
<tr>
<td>Leased from BLM</td>
<td>1,170</td>
</tr>
<tr>
<td>Lake Billy Chinook</td>
<td>1,700</td>
</tr>
</tbody>
</table>

A 50-year cooperative agreement, between the United States Department of Agriculture (USDA) and the State of Oregon, leasing lands under USDA administration located within the park boundary to the State, will expire April 19, 1990. However, the agreement will automatically be renewed unless written notice is given by either party not less than 90 days prior to its termination. See Appendix K.

1 From the Cove Palisades State Park Master Plan, State of Oregon Department of Transportation, 1981.
Development and operation of recreational facilities within the park has been the responsibility of the State. The Forest Service maintains control over minerals and fire management.

**Emphasis**
Manage for developed campgrounds and water related recreational activities.

**Desired Condition**
National Grassland ownership within the park boundary will be consolidated with park ownership to support a highly developed recreation experience under park management.
MA-G13 Lake Billy Chinook View Area

560 Acres

Description
This management area is the view area that can be seen from Lake Billy Chinook outside the Cove Palisades State Park and within the boundary of the Crooked River National Grassland.

Emphasis
Maintain the natural appearing characteristics of the viewshed from Lake Billy Chinook, where management activities are not evident, or they are visually sub-ordinated to the surrounding landscape.

Desired Condition
The view area will be an undeveloped, natural appearing landscape with scenic qualities.

MA-G14 Dispersed Recreation

90 Acres

Description
This prescription applies to dispersed recreation sites located throughout the Grassland. These sites generally occur along roads, and many are concentrated near riparian areas and stream courses. The prescription applies to the actual site and the influence area immediately around it.

Emphasis
Provide and maintain a near-natural setting for people to utilize while pursuing outdoor recreation experiences.
Desired Condition
Dispersed sites will exhibit a natural appearance, although management activities may be highly visible nearby. Primitive, user-constructed structures or facilities, consistent with the sites use, may be seen. Sites will be managed so that users tend to feel relatively isolated from the sights and sounds of civilization. A strategy will be developed that encourages individuals or groups to “find their own place.”

Livestock grazing may be evident but the successful application of allotment management requirements will also be evident.
MA-G15 Gray Butte Electronic Site

80 Acres

**Description**

Gray Butte is a designated electronic site for radio and television relay stations. It is located 15 miles south of Madras, 11 miles northeast of Redmond, and 15 miles northwest of Prineville. Gray Butte's elevation is 5,108 feet above sea level, and it rises approximately 2,300 feet in elevation above the surrounding area. The top of the butte contains approximately 5,400 square feet, on which there are presently three buildings and two towers. Access to the site is by Forest Road 5720-080. This road was constructed by permitees in 1967 and is not open to the general public. Use of the site by the permitees has increased steadily during recent years.

**Emphasis**

Manage the Gray Butte Electronic Site low-power-output electronic equipment and transmitters which do not exceed 150 watts.

**Desired Condition**

Gray Butte Electronic Site will have three buildings and three towers. The access road will be gated and closed to the general public under a CFR closure. The site will meet partial retention and will continue to provide a public service to central Oregon.

MA-G16 Utility Corridors

460 Acres

**Description**

This management area includes electric transmission lines, natural gas transmission lines, and railroads crossing the Grassland that have been identified and designated as corridors. These linear features are presently in use or proposed for the transport of gas, oil, water, or electricity.
Emphasis
Accommodate energy-transmission facilities.

Desired Condition
This prescription recognizes the need to establish a regional corridor system in the Western United States, as identified by industry in the “Western Regional Corridor Study” (1986). This system would accommodate growth in energy transmission facilities in a planned way, minimizing adverse environmental impacts while allowing logical and efficient development of energy transmission systems.

All development is in existing corridors. Exclusion and avoidance areas are identified. Design and management has made optimum use of lands allocated to power facilities.

Chapter 4

Grassland Management Direction

Section 3

Grassland-Wide and Management Area Standards and Guidelines
Chapter 4

Section 3

Grassland-Wide and Management Area Standards and Guidelines

Standards and guidelines state the bounds or constraints within which all management practices are to be carried out in achieving the planned goals, objectives and desired future condition. They are intended to supplement, but do not replace, policy direction found in Forest Service Manuals and Handbooks and the Regional Guide for the Pacific Northwest Region. They also must comply with applicable State and Federal laws and regulations.

Grassland-wide and management area standards and guidelines are grouped together by resource (or functional area), so that the user will have the total management direction available in one package. The general standards and guidelines apply to all areas on the Crooked River National Grassland. Management area standards and guidelines are site specific; they must be in compliance with Grassland-wide standards and guidelines, as well as higher order policy, regulation, and law.

Some resource direction is only applicable on a Grassland-wide basis, and does not vary by management area. Therefore, no management area standards and guidelines are presented for the following resources: Air Quality, Biological Diversity, and Social and Economic.
Air Quality

Grassland-Wide Standards and Guidelines
Maintain air quality on the Grassland at a level which meets or exceeds applicable Federal and State standards and regulations. Comply with regulations of the Clean Air Act, as amended, and coordinate activities with the Oregon State Department of Environmental Quality and the Oregon State Department of Forestry.

Demonstrate reasonable progress in reducing total suspended particulate (TSP) emissions from prescribed burning. Monitor particulate emissions originating from Grassland activities as outlined in Chapter 5, Implementation of the Grassland Plan.

Conduct prescribed burning in accordance with State smoke management plans.

Follow Regional standards and guidelines for smoke emissions as stated in the Regional Vegetation Management Final Environmental Impact Statement.

Use the best available predictive methods and models, and most cost-efficient technologies to minimize the impact of prescribed burning on the Grassland and adjacent lands.

Protect the Grassland air resources against pollution sources outside the Grassland boundaries through application of the Prevention of Significant Deterioration (PSD) regulations contained in the Clean Air Act. Take appropriate action to contact the Oregon State Department of Environmental Quality when outside air pollution sources (chiefly those originating on a regular seasonal basis from the Madras basin and Willamette Valley) exceed Grassland standards.

Biological Diversity

Grassland-Wide Standards and Guidelines
Research Natural Areas (RNA's), featuring unique community types, are to be maintained and protected from influences which detract from their purposes. Monitor vegetation to insure that all major vegetative types and unique plant communities are preserved for future knowledge and gene pool diversity.

Identify and manage unique ecological situations through the Grassland implementation and monitoring process. Examples of these include: eagle roosting, representative examples of old growth juniper, aspen clones, river canyons, and riparian areas.
Maintain soil productivity through management practices which reduce erosion, and through the application of guidelines that limit use of heavy equipment.

Protect fragile sites such as shallow soil areas (scablands) and natural meadows.

Incorporate and design habitat-specific species requirements—such as those for cavity excavators—into guidelines and prescriptions for individual projects.

Monitor plant communities/associations to determine conditions and trends. Encourage recovery or prevent deterioration where activities may be leading to poor conditions; downward trends, the displacement of native plants or plant communities by unusually weedy, annual, or noxious vegetation; or where cover is untypically low for the particular plant associations (see Hall, 1973; Hopkins and Kovalchik, 1983). Manage aspen stands to produce a vigorous population

Limit the frequency of underburning of plant communities to the natural fire cycle, or less frequently, until research is completed on ecological effects of burning.
Cultural Resources

Grassland-Wide Standards and Guidelines

Update the existing Cultural Resource Overview each decade to incorporate all known cultural resource information on each District. The Overview will provide a framework for evaluating cultural resources located through survey efforts, will assist in the development of a Forest Inventory Plan approved by the Oregon State Historic Preservation Office (SHPO), and will help to identify opportunities for site interpretation.

Conduct cultural resource surveys (inventories) in advance of all ground-disturbing actions. Both project and non-project areas will be surveyed during the earliest stages of the planning (NEPA) process; this will be accomplished through the implementation of the Interim Inventory Design (Dyrden, 1988) or Forest Inventory Plan (when formally approved) Submit project Cultural Resource Reports for SHPO review and Section 106 (National Historic Preservation Act, as amended) compliance prior to issuance of the Decision Notice and Environmental Assessment or Environmental Impact Statement.

Evaluate cultural resource properties located during inventory to determine their eligibility to the National Register of Historic Places. This will be accomplished through the Lithic Scatter Programmatic Memorandum of Agreement (PMOA), individual site and thematic Determinations of Eligibility.

Develop contexts and themes from which to evaluate all classes of sites through thematic Determinations of Eligibility. Develop management plans, Memorandums of Agreement (MOA's), and PMOA's in cooperation with the State Historic Preservation Office, the Advisory Council on Historic Preservation, and other interested publics (Native Americans, local historical societies, groups and professional organizations) to facilitate cultural resource treatment and future management.

Document, through the NEPA process, the results of cultural resource surveys for all proposed ground-disturbing projects (federal, federally-funded or permitted) or projects determined to have an effect upon cultural resource sites or values.

Prepare a Determination of Effect for all projects and submit for Oregon SHPO review and consultation (i.e. No Effect, No Adverse Effect, or Adverse Effect).

Mitigate adverse effects to eligible and significant sites under consultation with the Oregon SHPO, Advisory Council on Historic Preservation, and interested publics. In ranked order of preference, the following treatment options will be considered:

1. Avoidance through project design modification or abandonment (No Effect).
2. Combination of project modification and scientific data recovery under an
approved data recovery plan (No Adverse Effect or Mitigation of Adverse Effect).

3. Data recovery and analysis such that cultural resource values are protected and preserved in forms useful to various scientific, government, ethnic and local groups (Mitigation of Adverse Effect).

Cultural resource sites, districts and thematic classes of such will be nominated to the National Register of Historic Places. Schedule nominations incrementally until the Forest-wide inventory of cultural resources is completed. Protect significant sites from degradation due to public use or natural deterioration. Protection methods may include, but are not limited to, scientific study and collection, the use of fences or barriers, prudent use of signs, site stabilization, closure orders, site monitoring, area patrolling, and restriction of access to site locational information as provided for under the provisions of the Freedom of Information Act.

Interpret and enhance selected sites for the education and enjoyment of the general public. A priority will be given to sites within or adjacent to public use areas, and which are being degraded through natural or human impacts. Produce scientifically accurate and culturally sensitive displays, brochures, posters, tours, lectures, etc. Support the distribution of scientific reports, monographs, video tapes, and books for the benefit of interested members of the public. Promote public-private partnerships which will benefit Forest visitors through enhancing and interpreting sites.

Burial Sites
Treat historic or prehistoric burial remains as follows:

Evaluate the site to determine if the skeletal material is human and to what time period or ethnic group it may be ascribed.

Contact local authorities, Native American Tribal Group(s), other ethnic groups and County Historical Societies where appropriate.

For Native American burials, reinter in-place with involvement by the appropriate representatives of a federally recognized Tribe or Native American group. Project planning for management activities in the site vicinity shall consider burial location in planning decisions, and if necessary, modify implementation to avoid direct and indirect impacts to the burial site.

Where reinterment in-place is not feasible or prudent, alternative locations for reinterment will be reviewed and selected in consultation with the appropriate Indian Tribal representatives. In situations where a direct link cannot be made to an existing Federally recognized Tribe, this consultation shall take place with the nearest tribe or confederation.

Religious Freedom
Meet all requirements of the American Indian Religious Freedom Act (AIRFA). This law makes it the policy of the Federal government “to protect and preserve for American Indians their inherent right of freedom to believe, express, and
exercise [their] traditional religions.” This protection includes, but is not limited to, access to sites, use and possession of sacred objects, and the enactment of ceremonies and traditional rites. Related activities include the gathering and processing of plants for food, medicinal, or craft uses, and the construction of sweat lodges, or “vision quest” structures.

AIRFA addresses the religious freedom of all Native Americans without regard for Federal tribal recognition, but does not convey exclusive use of areas or free use of Forest products. While considering access to properties or sites within its boundaries, the Forest will examine other potential or existing uses and activities. Publicly owned properties, sites, objects of antiquity, etc. remain the property of the United States government. Activities which may effect such properties, sites, or objects are subject to existing laws, regulations and treaties.

Treaty Rights
Honor the rights reserved by the Confederated Tribes of Warm Springs Indians for lands ceded to the Federal Government through the Treaty of 1855.

On the ceded lands, the Tribes have the right to take fish in streams running through and bordering the Reservation and at all other usual and accustomed stations in common with the citizens of the United States.

The right of hunting, gathering roots and berries, and pasturing stock on unclaimed lands in common with citizens was also secured within the ceded lands.

Management Area Standards and Guidelines

Resource - Cultural Resources

Practice
Enhancement and Interpretation

Standard and Guideline
On-site interpretation and enhancement of cultural resources will not be done. Off-site interpretation and enhancement is permissible.

Applicable Management Area
MA-G5 Juniper Old Growth
MA-G15 Gray Butte Electronic Site
MA-G16 Utility Corridors

Standard and Guideline
Enhancement and interpretation of cultural resources will not be emphasized.
Significant cultural resource sites and features may be enhanced and interpreted if the action does not detract from the management area objectives.

**Applicable Management Area**
MA-G4 Research Natural Areas
MA-G8 Squaw Creek
MA-G11 Haystack Reservoir
MA-G12 Cove Palisades State Park

---

**Standard and Guideline**
Selectively enhance and interpret cultural resources, with priority on identifying sites that will complement the management emphasis of the specific areas.

**Applicable Management Area**
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range
MA-G3 General Forage
MA-G6 Crooked River Recreation River Area
MA-G7 Deschutes River Scenic Corridor
MA-G9 Riparian Areas
MA-G10 Rimrock Springs Wildlife Area
MA-G13 Lake Billy Chinook View Area
MA-G14 Dispersed Recreation

---

**Facilities**

**Grassland-Wide Standards and Guidelines**
Plan, develop, maintain, and operate buildings, utility systems and related facilities for safe use, support of Grassland resource programs, and cost effectiveness. Historic buildings will be managed in accordance with the Programmatic Memorandum of Agreement (PMOA) for Depression-Era Administrative Buildings.

Insure that the construction of new buildings or additions to existing buildings and utility systems complies with approved site development plans.

Provide and manage administrative facilities sufficient to accomplish land and resource management and protection objectives of the Grassland. Prepare an administrative site development plan for the Grassland field headquarters. Recognize that the field headquarters is eligible for the National Register of Historic Places. Clear proposed improvements through the State Historic Preservation Office (SHPO). Consider long-term development and maintenance costs in planning of facilities.
Management Area Standards and Guidelines

Resource - Facilities

**Practice**
Construction, Reconstruction and Maintenance of Administrative Buildings and Structures

**Standard and Guideline**
No administrative buildings or structures allowed.

**Applicable Management Area**
MA-G5 Juniper Old Growth
MA-G4 Research Natural Areas

**Standard and Guideline**
Allow no administrative facilities within floodplains unless no feasible alternative sites exist (Executive Order 11988).

**Applicable Management Area**
MA-G9 Riparian
Grassland-Wide Standards and Guidelines

Fire Management

Planning
Use the National Fire Management Analysis System to determine the most cost-efficient fire protection organization. Reevaluate organization as conditions change and better information is developed. Due to the nature of intermixed land ownerships, including a number of wildland subdivisions, interagency cooperation must be considered in the planning process.

Prevention
Monitor current and recent fire reports to target specific risks. Coordinate activities through the Central Oregon Fire Prevention Cooperative (or its equivalent).

Detection
Periodically review the mix of aerial and ground detection activities to maintain the most cost-effective combination.

Initial Attack
Apply aggressive suppression action to wildfires that threaten life, private property, public safety, improvements, or investments.

Where wildfires do not threaten to exceed acceptable sizes and intensities, apply the lowest cost suppression option.

If a wildfire escapes initial action and threatens to exceed established limits, prepare an escaped fire situation analysis. Weigh the cost of suppression against the resource potential losses. Suppression costs should be commensurate with the values threatened.

Secondary Attack Forces
Provide equipment and training for Forest Service employees outside of the fire management organization to assist in initial attack.

Fuel Treatments
Burn excess residues from management activities or natural events only after an interdisciplinary team evaluation of site needs and appropriate utilization efforts have been considered. The Ochoco National Forest Residue Management Plan, 3/89, will be used as a guide for identifying site-specific treatment selections.
Prescribed Fire
All planned prescribed fires will have prescriptions approved by the appropriate line officer.

Unplanned ignitions may be used as prescribed fire if: 1) a prescribed fire plan has been prepared and approved, 2) the fire is burning within prescription, and 3) there are enough personnel and equipment available to provide the staffing necessary to carry out the existing prescribed fire plan.

Conduct prescribed burns within existing Federal and State regulations affecting the timing, duration, and dispersal of emissions. Coordination with adjacent local smoke management groups and local agency offices will be required.

Construct water diversions on firelines in hilly or steep terrain to drain water into areas with sufficient vegetation or other protection to avoid erosion.

Provide for a protective strip of undisturbed surface between the prescribed burn area and perennial water courses, considering local topographic, vegetation, and soil characteristics.

Avoid intense prescribed fires on soils that are highly erodible and/or are subject to the development of hydrophobic (nonwettable) conditions.

Fuelbreaks
Use existing transportation and topographic features as much as possible for planned fuel breaks.

Use fuelbreaks only where risk analysis indicates this to be the most economically viable alternative treatment, and where doing so meets the objectives of management are a prescriptions, listed in Section 2, this chapter.

Piling and Burning
Locate piles outside of the normal high water flow area of natural and man-made drainages or water courses.

Burn slash piles located within mapped floodplains within one year after piling.

Remove slash created within the normal high water zone of a stream, unless needed for soil protection purposes.

Slash will not be piled on scablands unless there is no other feasible location, i.e. under circumstances dictated by topography (see Soils Standards and Guidelines).

Chipping, Burning, Lopping, and Scattering
Dispose of material so it will not reach stream courses.

Disperse material over a wide area when practical.
Management Area Standards and Guidelines

Resource - Fire

Practice
Suppression

Standard and Guideline
Use appropriate suppression strategy (confine, contain, control) identified in the economic efficiency analysis for each preattack block.

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G3 General Forage

Standard and Guideline
Maximum acceptable wildfire acres at Fire Intensity Level III is 5,000 acres per decade.

Applicable Management Area
MA-G3 General Forage

Standard and Guideline
Control all wildfires except on Island Research Natural Area.

Applicable Management Area
MA-G12 Cove Palisades State Park

Standard and Guideline
Minimize physical disturbances. Confine, contain, or control fires utilizing confine or contain strategies whenever possible.

Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek
MA-G13 View Area Lake Billy Chinook
MA-G14 Dispersed Recreation
Standard and Guideline
Control all wildfires.

Applicable Management Area
MA-G11 Haystack Reservoir
MA-G15 Gray Butte Electronic Site

Standard and Guideline
Minimize acreage affected by wildfire. Suppress fires using the tactical strategy of control. Minimize damage from suppression activities.

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Use appropriate suppression strategy (confine, contain, control) identified in the economic efficiency analysis with due regard for prescribed fire plans for the area.

Maximum acceptable wildfire acreage per decade at Fire Intensity Level III is 500 acres.

Applicable Management Area
MA-G2 Metolius Deer Winter Range

Standard and Guideline
Permit no suppression of natural fires on the Island RNA. Suppress natural fires on Haystack Butte only if facilities or resources outside the RNA are threatened.

Use only water as a retardant.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Confine, contain, or control all wildfires with due regard for prescribed fire plans (see Wildlife).

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
Standard and Guideline
Limit mechanical suppression activities to avoid excessive disturbance to riparian zones to avoid disturbing soil or vegetation. Contain or control fires.

Maximum acceptable wildfire acreage at Fire Intensity Level III is the same as surrounding management areas.

Applicable Management Area
MA-G9 Riparian

Standard and Guideline
Allow prescribed burning when feasible. Completely dispose of slash. The minimum acceptable suppression response is “contain” at all Fire Intensity Levels.

Applicable Management Area
MA-G16 Utility Corridors

Practice
Prevention

Standard and Guideline
Encourage the State of Oregon to post appropriate fire prevention information. Inform visitors about fire prevention and regulations.

Applicable Management Area
MA-G12 Cove Palisades State Park

Practice
Prescribed Fire

Standard and Guideline
Use no prescribed fire.

Applicable Management Area
MA-G15 Gray Butte Electronic Site

Standard and Guideline
Normally, utilize manual and mechanical methods of fire hazard reduction. Prescribed fire may be used under limited circumstances.
Applicable Management Area
MA-G11 Haystack Reservoir
MA-G14 Dispersed Recreation

Standard and Guideline
Use prescribed fire only to reduce fuel load if natural fuels accumulate to a level likely to result in a catastrophic fire.

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Use prescribed fire to maintain the naturalness of the area, provide scenic diversity, and vegetative management.

Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek (includes proposed "scenic river" segment)

Standard and Guideline
Allow the use of managed or naturally occurring fire as needed to perpetuate the plant community the RNA is meant to represent.

Where prescribed fire is used to perpetuate a plant community, it should mimic a natural fire but be managed prudently to avoid catastrophe.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Allow fuels to accumulate at natural rates unless they threaten the objectives of the management area.

Applicable Management Area
MA-G4 Research Natural Areas
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor

Standard and Guideline
On firelines constructed in hilly or steep terrain, install water diversions to drain water into areas with vegetation or other protection sufficient to avoid erosion.
Where possible, provide for a protective strip of undisturbed surface between the prescribed burn area and perennial water courses, considering local topographic, vegetation, and soil characteristics.

**Applicable Management Area**
MA-G9 Riparian

---

**Standard and Guideline**
Use prescribed fire periodically to improve big game winter habitat and reduce fuel conditions on a periodic basis.

**Applicable Management Area**
MA-G1 Antelope Winter Range  
MA-G2 Metolius Deer Winter Range  
MA-G8 Squaw Creek

---

**Standard and Guideline**
May be used to meet visual management objectives.

**Applicable Management Area**
MA-G6 Crooked River Recreation Area  
MA-G7 Deschutes River Scenic Corridor  
MA-G8 Squaw Creek  
MA-G13 Lake Billy Chinook View Area

---

**Practice**

**Fuel Break Construction and Maintenance**

**Standard and Guideline**
Maintain fuel breaks only where risk analysis shows them to be economically feasible.

**Applicable Management Area**
MA-G3 General Forage

---

**Standard and Guideline**
Construct and maintain no fuel breaks.

**Applicable Management Area**
MA-G5 Juniper Old Growth  
MA-G9 Riparian
Standard and Guideline
Maintain fuel breaks only where they do not conflict with wildlife goals, especially with regard to thermal cover.

Applicable Management Area
MA-G2 Metolius Deer Winter Range

Practice
Treatment of Natural Fuels

Standard and Guideline
Emphasize protecting cover needs.

Applicable Management Area
MA-G2 Metolius Deer Winter Range

Forage and Livestock Use

Grassland-Wide Standards and Guidelines

Unsatisfactory Condition Identification and Improvement
Identify lands in unsatisfactory condition. Develop allotment management plans with specific objectives for these lands on a priority basis under a schedule established by the Forest Supervisor. These objectives will define desired future conditions based on existing and potential values for all resources. Include in allotment management plans: (1) a schedule for improvement; (2) activities needed to meet forage objectives; and (3) an economic efficiency analysis.

Forage Utilization
Utilization tables have been developed for “Primary Range” (Table 4-3) and “Riparian” (Table 4-4). In addition, special seasonal restrictions (for fall greenup) have been directed for individual management areas.

Administration and Grazing Systems
Administer lands available and suitable for domestic livestock grazing according to the grazing agreement with the Gray Butte Grazing Association.

Utilize intensive grazing management systems where feasible.

Develop, revise, and maintain allotment management plans to incorporate Grassland Plan direction.
Control noxious weeds and invader plants to prevent threats to adjacent agricultural lands or to prevent unacceptable loss of range productivity.

Encourage demonstration projects when they are compatible with other standards and guidelines.

Management Area Standards and Guidelines

Resource - Forage

**Applicable Management Area**
MA-G1 Antelope Winter Range

**Standard and Guideline**
Allow no livestock grazing.
Applicable Management Area
MA-G12 Cove Palisades State Park
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor

Standard and Guideline
Continue to keep campground closed to livestock grazing.

Applicable Management Area
MA-G11 Haystack Reservoir

Standard and Guideline
Maintain early season livestock use.

Applicable Management Area
MA-G2 Metolius Deer Winter Range

Standard and Guideline
Permit no grazing of domestic livestock within the RNA unless needed to maintain a specific vegetative type.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Use periodic high intensity grazing as a tool to maintain the desired vegetative communities and habitat types.

Maintain pastures for Forest Service horses.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area

Standard and Guideline
See Table 4-4.

Applicable Management Area
MA-G9 Riparian
Forage and Livestock Use

Standard and Guideline
Allow no livestock grazing within lower Squaw Creek canyon (the 1,370 acre segment proposed for Wild and Scenic River designation). Utilize grazing systems that protect and complement the deer winter range and riparian areas.

Applicable Management Area
MA-G8 Squaw Creek

Practice
Nonstructural Improvements

Standard and Guideline
Allow mechanical and nonmechanical treatments that are compatible with the primary objectives of the management area. Manage to keep shrub species (primarily big sagebrush) at or below 24 inches in height, and definitely not over 30 inches in height.

Applicable Management Area
MA-G1 Antelope Winter Range

Standard and Guideline
Allow mechanical and nonmechanical treatments.

Applicable Management Area
MA-G3 General Forage

Standard and Guideline
Permit only nonstructural improvements that are compatible with the primary objectives of the management area.

Applicable Management Area
MA-G5 Juniper Old Growth
MA-G2 Metolius Deer Winter Range

Standard and Guideline
Use prescribed fire or controlled livestock grazing to maintain productive vegetation.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
**Standard and Guideline**  
Manage vegetation to decrease bare soil areas.

**Applicable Management Area**  
MA-G9 Riparian

---

**Standard and Guideline**  
See adjacent management areas (except for prescribed burning).

**Applicable Management Area**  
MA-G16 Utility Corridors

---

**Practice**  
Structural Improvements

---

**Standard and Guideline**  
Maintain existing improvements where they are not in conflict with the primary objectives of the management area.  
Construct additional improvements where they will aid in improved livestock management.
Guidelines for constructing or reconstructing fences:

(1) Topwire: Not more than 40 inches above the ground. Bottom wire: Smooth wire at least 18 inches above the ground.

(2) Use white-topped fence posts.

After the livestock are off the Grassland in the fall, leave gates open to facilitate antelope passage (except where needed for road management objectives).

**Applicable Management Area**
MA-G1 Antelope Winter Range

**Standard and Guideline**
Maintain existing developments. Construct additional water developments to improve forage availability where project level analysis shows these developments to be cost-efficient. Design and locate improvements to disperse livestock away from riparian areas and alleviate other resource problems. Priority projects will be those with the highest present net value that reduce resource problems.

**Applicable Management Area**
MA-G3 General Forage

**Standard and Guideline**
Maintain existing improvements. Permit new improvements only when they are compatible with the primary objectives of the management area.

**Applicable Management Area**
MA-G5 Juniper Old Growth

**Standard and Guideline**
Maintain existing developments where they are not in conflict with the desired future condition of the management area.

Construct additional developments as needed to aid in livestock distribution and facilitate using domestic livestock as a management tool to improve the palatability and availability of winter deer forage.

**Applicable Management Area**
MA-G2 Metolius Deer Winter Range
Standard and Guideline
Construct and maintain fences needed to exclude livestock.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Maintain existing fences and corrals.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area

Standard and Guideline
Allow developments that meet the desired condition as follows:
Locate improvements to disperse livestock away from riparian areas.
Construct water developments to better distribute livestock.
Fence corridors to exclude livestock.

Applicable Management Area
MA-G9 Riparian

Standard and Guideline
Only those structural improvements compatible with Wild and Scenic Rivers
Rivers management objectives will be allowed

Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek (Proposed 1,370-acre "scenic river" segment)

Practice
Allotment Management Plans

Standard and Guideline
Identify action needed to meet riparian objectives within a specific time frame.
Set objectives for key parameters, such as stream surface shade, streambank
stability, and shrub cover. The process is described in Managing Riparian Ecosys-
tems (Zones) for Fish and Wildlife in Eastern Oregon and Eastern Washington,
(1979).

Applicable Management Area
MA-G9 Riparian

1/ This will be incorporated in annual operating plans and Allotment Management Plans. Allotment Management Plans may include utilization standards which are either higher or lower than associated with intensive grazing systems and specific vegetation management objectives which will meet objectives for the riparian dependent resources. Includes cumulative annual use by big game livestock.

2/ Utilization based on percent of total annual forage production removed by weight.

3/ Utilization based on percent of the current years growth removed. Example measure length of current years growth of browsed and unbrowsed leaders and determine incidence of use. Calculate percent of current years growth removed.

* For satisfactory and unsatisfactory condition see Glossary in FEIS
Fuelwood

Grassland-Wide Standards and Guidelines
Allow fuelwood cutting primarily to meet other resource objectives.
Permit fuelwood removal only in designated areas.
Sign wildlife trees (which are not to be cut) near roadsides or other areas accessible to firewood cutters.
Allow only juniper to be cut unless otherwise designated.
Allow no firewood cutting in designated old growth juniper areas.
Consider soil moisture, productivity, and compaction when managing fuelwood areas.

Management Area Standards and Guidelines

Resource - Fuelwood

Practice
Commercial and Personal Gathering

Standard and Guideline
Allow no fuelwood gathering.

Applicable Management Area
MA-G4 Research Natural Areas
MA-G5 Juniper Old Growth
MA-G15 Gray Butte Electronic Site

Standard and Guideline
Allow fuelwood gathering for on-site use only.
Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek
MA-G11 Haystack Reservoir Area
MA-G13 Lake Billy Chinook View Area
MA-G12 Cove Palisades State Park
MA-G14 Dispersed Recreation

Standard and Guideline
Fuelwood cutting areas will only be provided where used as a tool to provide a proper cover/forage ratio for optimum big game winter range.
Do not allow fuelwood cutting when deer are concentrated on the winter range.

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range

Standard and Guideline
Allow no firewood cutting or removal of vegetation, except for approved research related activities.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Designate no fuelwood areas.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area

Standard and Guideline
See adjacent management areas.

Applicable Management Area
MA-G16 Utility Corridors

Standard and Guideline
Firewood gathering subject to permit regulations only.

Applicable Management Area
MA-G3 General Forage
Grassland Health

Grassland-Wide Standards and Guidelines
Use Integrated Pest Management (IPM) strategies to manage pests within the constraints of laws and regulations, and meet Grassland management objectives. IPM strategies include manual, mechanical, cultural, biological, chemical, prescribed fire, and regulatory means. Select strategy through the environmental analysis process, and in compliance with the Regional Vegetation Management Environmental Impact Statement, 1988.

Coordinate strategies with the Agricultural Pest Health Inspection Service (APHIS) when proposing major control projects.

Pesticide application, if used, will conform with EPA regulations, label restrictions, and the Regional Environmental Impact Statement on chemical applications.

Management Area Standards and Guidelines

Grassland Health

Practice
Insects & Disease

Standard and Guideline
Take no action to control insects, disease or noxious weeds unless the outbreak drastically alters the natural ecological processes within the RNA.

Applicable Management Area
MA-G4 Research Natural Areas
Grassland -Wide Standards and Guidelines

Utility Corridors

Existing state highways, electric transmission lines, natural gas transmission lines, canals, and railroads have been identified and designated as utility corridors. Avoidance areas are identified and corridor widths set (see Utility Corridor and Electronic Site Map, Figure 4-1). Allow no exclusion areas and no windows. Additional facilities will be confined within the existing corridors whenever feasible. Upgrading of present facilities will be considered prior to adding facilities. Designation of corridors does not imply entitlement of use and environmental analysis must precede occupancy on a project-specific basis. Whenever possible, utility rights-of-way will be designated to allow joint use of the right-of-way.

Identify and approve additional utility corridors only after site specific environmental analysis has been done (including analyzing the alternative of moving energy through existing corridors). Coordinate analysis with other Forests and land management agencies. Determine the lead agency and develop a study plan prior to the start of any analysis. Analysis will be done in accordance with the environmental analysis process and with procedures set forth in the Regional Guide. The Grassland Plan will be amended to include additional corridors approved through this process.

Determine the compatibility of each alternative with the management areas affected. If a route is not compatible with the management area direction and other alternatives are not feasible, amend the plan through the NEPA process.

Electronic Sites

Manage Gray Butte in accordance with the site plan being developed, Forest service Manual 2728, and Forest Service handbooks (see Utility Corridor and Electronic Site Map, Figure 4-1). Allow no additional electronic sites on the Grassland.

Allow no development or expansion of electronic uses on Buck Butte, Juniper Butte, or Round Butte.

Other Uses

Review applications for other uses through the NEPA process.

Issue new special use permits through a prospectus process when a competitive interest has been identified.
Recreational Special Uses
Issue recreational special use permits only after a public need has been demon-
strated that applies to a significant number of the recreating public. This policy
may not include business opportunities.

The experience provided through the permit must be compatible with the Rec-
reational Opportunity Spectrum (ROS) classification of the management area.

Limit the number of special use permits for a specific use, to the extent possible,
in order to minimize administrative costs and to create economic conditions that
provide a high quality public service.

Minimize the impact of special use permits on other users through the operating
plans.

Land Ownership
Acquire and dispose of lands in accordance with the Land Ownership Map and
Plan (see Appendix B).

Survey and mark property boundaries to prevent encroachments, protect pres-
ent corners or references where the possibility of disturbance exists, and assist in
administration of the Grassland.

Identify and resolve encroachments as they are identified.

Management Area Standards and Guidelines

Resource - Lands

Practice
Land Ownership and Adjustment

Standard and Guideline
Acquire lands as needed (see Category 2 of the Grassland Ownership Plan, Ap-
pendix E).

Applicable Management Area
MA-G1 Antelope Winter Range

Standard and Guideline
Cooperate with the State in defining an optimum ownership pattern and lease
terms.
Applicable Management Area
MA-G12 Cove Palisades State Park

Standard and Guideline
Acquire private inholdings (see Land Ownership Map and Plan, Appendix B). Seek transfer of Bureau of Reclamation (BOR) lands to the Forest Service.

Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek
MA-G13 View Area

Standard and Guideline
Retain and acquire all lands in National Forest System ownership (see Land Ownership Map and Plan, Appendix B). Seek transfer of Reclamation (BOR) lands to the Forest Service.

Applicable Management Area
MA-G11 Haystack Reservoir

Standard and Guideline
Retain old growth lands unless they are small isolated blocks surrounded by privately owned lands (see Land Ownership Map and Plan, Appendix B).

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Acquire lands that support wildlife management goals. Lands in this management are in Category 2 (see Land Ownership Map, Appendix B).

Applicable Management Area
MA-G2 Metolius Deer Winter Range

Standard and Guideline
Retain all lands, and acquire inholdings (see Land Ownership Map and Plan, Appendix B).

Applicable Management Area
MA-G4 Research Natural Areas
Standard and Guideline
Retain all lands.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
MA-G15 Gray Butte Electronic Site

Standard and Guideline
Retain or acquire lands except for small, isolated blocks surrounded by privately owned lands (see Land Ownership Map).

Applicable Management Area
MA-G9 Riparian

Practice
Special Uses

Standard and Guideline
Grant no special use permits that would have a direct and adverse effect.

Applicable Management Area
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek (proposed "scenic river" segment)

Standard and Guideline
Only allow minimal, temporary or semipermanent research facilities and installments.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Allow only special use permits for activities that are consistent with the visual management objectives for the area.

Applicable Management Area
MA-G13 Lake Billy Chinook View Area

Practice
Rights-of-Way

**Standard and Guideline**
Grant no rights-of-way.

**Applicable Management Area**
MA-G4 Research Natural Areas
MA-G5 Juniper Old Growth
MA-G10 Rimrock Springs

---

**Standard and Guideline**
Grant rights-of-way only where there are no alternate routes.

**Applicable Management Area**
MA-G2 Metolius Deer Winter Range
MA-G9 Riparian

---

**Standard and Guideline**
Establish no exclusion areas on the Grassland. Avoidance areas include Squaw Creek, Haystack RNA, Island RNA, Rimrock Springs, and Antelope Winter Range (see individual management area prescriptions).

Corridor widths are 1,000 feet for each existing corridor. Confine additional facilities to existing corridors. Require present facilities to be upgraded before allowing new facilities.

Designation of corridors does not imply entitlement of use. Evaluate application for use on a project-by-project basis.

Where possible, encourage joint use of the rights-of-way.

Additional utility rights-of-way or corridors may be identified and approved subject to site-specific environmental analysis.

**Applicable Management Area**
MA-G16 Utility Corridors
Grassland-Wide Standards and Guidelines

Require that operating plans and permits include reclamation plans describing final management objectives for areas disturbed during mining operations. Insure that reclamation plans include reasonable and practical procedures and timeframes for accomplishing the objectives. Base reclamation bonds on actual reclamation costs formulated using appropriate technical and other resource input.

Notify lessees of impending Forest Service actions that may affect their claims or leases. Reasonable effort should be made to protect mine workings from disturbance as a result of Forest Service activities.

Nonenergy Minerals

Lands administered under the Bankhead-Jones Act are not open to mining claim location. However, leases for nonenergy (hardrock) mineral exploration and development may be issued on acquired lands when the mineral estate is owned by the Federal Government.

Mineral Leases

Evaluate surface-use plans of operations through the environmental analysis and documentation process.

Common Variety Minerals

Use existing sources instead of developing new sources; exceptions include:

- when existing sources are unable to economically supply the quantity and quality of material needed,
- when conflicts with other resource uses are found to be unacceptable.

Cinder, hardrock, and gravel sources which are available for use during the planning period are designated on the Material Source Map (on file at the Ochoco National Forest Supervisor’s Office).

On lands acquired under the authority of the Bankhead-Jones Act, common variety materials may be disposed of only to public agencies, and only for public purposes.

Proposals for capital investments and improvements on structures, which may occur on known material source deposits, should be analyzed within the context of management direction within this Plan. Do not unnecessarily reduce options for future removal of materials by making significant investments on sources when equally viable options exist in other areas.
Allow no occupancy or other surface disturbance on slopes in excess of 30 percent without written permission.

Allow no occupancy of surface disturbance in the vicinity of eagle, hawk, or owl nesting sites as specified in Wildlife and Fish Standards and Guidelines. Specified distances may be modified when specifically approved.

Require all semipermanent and permanent facilities to be painted or camouflaged in order to maintain aesthetic value.

**Rockhounding**

Rockhounding (hunting and collecting rocks and minerals as a hobby) on land under Forest Service jurisdiction and where the Forest Service holds the mineral estate does not require a permit if: the land is open to mineral entry; the activity does not conflict with existing rights, and specimens are used for personal, non-commercial use (FSM 2861). Activities involving other than casual removal of small amounts of material with minimal surface disturbance are provided for under the mining or leasing laws or Materials Act.

---

**Management Standard and Guidelines**

**Resource - Minerals and Energy**

---

**Practice**

Leasing and Common Variety Minerals

**Standard and Guideline**

Allow exploration, drilling, and other developmental activities only between April 1 and November 15 to reduce harassment to antelope on the winter range. This limitation does not apply to maintenance and operation of producing wells.

**Applicable Management Area**

MA-G1 Antelope Winter Range

---

**Standard and Guideline**

Close and rehabilitate the existing rock source due to low demand and unsuitable material.

**Applicable Management Area**

MA-G12 Cove Palisades State Park
**Standard and Guideline**  
Allow no use, occupancy, or surface disturbance within the river corridor.

**Applicable Management Area**  
MA-G6 Crooked River Recreation Area  
MA-G7 Deschutes River Scenic Corridor  
MA-G8 Squaw Creek (proposed "scenic river" segment)

---

**Standard and Guideline**  
Allow no occupancy or other surface disturbance.

Common mineral material sources should not be inventoried or developed.

**Applicable Management Area**  
MA-G4 Research Natural Areas  
MA-G5 Juniper Old Growth  
MA-G9 Riparian  
MA-10 Rimrock Springs Wildlife Area  
MA-G11 Haystack Reservoir  
MA-G12 Cove Palisades State Park  
MA-G13 Lake Billy Chinook View Area  
MA-G15 Gray Butte Electronic Site

---

**Standard and Guideline**  
Allow exploration, drilling, and other developmental activities only between April 1 and November 15 to reduce harassment to deer on the winter range. This limitation does not apply to maintenance and operation of producing wells.

**Applicable Management Area**  
MA-G2 Metolius Deer Winter Range

---

**Standard and Guideline**  
Allow no occupancy or other surface disturbance within Squaw Creek canyon. Elsewhere, allow exploration, drilling, and other developmental activities only between April 1 and November 15 to reduce harassment to deer on the winter range. This limitation does not apply to maintenance and operation of producing wells.

**Applicable Management Area**  
MA-G8 Squaw Creek (proposed "scenic river" segment)
Recreation

Grassland-Wide Standards and Guidelines

General
Recreational activities will be managed to prevent site deterioration within riparian areas.

Developed Sites
Prepare site plans prior to rehabilitation, expansion, or construction projects.
See specific management area standards and guidelines for Haystack Reservoir and Rimrock Springs Wildlife Area.

Dispersed Recreation
Provide a variety of dispersed recreational opportunities.
Provide facilities needed to protect public health and safety, e.g., portable toilets and campfire rings.

Off-Road Vehicles (ORV'S)
Provide opportunities for ORV's on roads that are closed to full-sized vehicles and on other designated trails.
In compliance with the Travel Plan (Appendix D), close roads, trails, and areas, as needed, to protect soil, watershed, wildlife, riparian areas, or nonmotorized recreation.

Special Interest Areas
Protect the outstanding values of the designated and potential Wild and Scenic Rivers corridors.
Identify and protect special natural features, e.g., natural springs, rock formations, weeping walls, petroglyphs, cultural and historic districts.

Trails
Identify and provide a trail system to provide for a variety of uses, such as hiking, horseback riding, endurance horseback riding, mountain bicycling, ATVs, motorcycling, and for the needs of the handicapped.
Construct and maintain the trail system to standards suitable for type and amounts of use. Maintain trails to prevent resource damage, protect the investment in the system, and provide for user safety.
Allow horses and hikers on most trails. Limit use or implement other techniques as needed to prevent or reduce erosion.
Encourage partnerships or volunteers to maintain or construct trails.

4-95
Practice
Dispersed

Standard and Guideline
Protect the natural environment in and around dispersed camp sites.
Do not encourage dispersed recreational use during the time antelope or mule deer are concentrated on the winter range.

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range
MA-G14 Dispersed Recreation

Standard and Guideline
Manage for Roaded Modified/Roaded Natural recreational opportunities. Protect natural setting in and around dispersed sites.

Applicable Management Area
MA-G3 General Forage

Standard and Guideline
Manage to protect the naturalness of the areas. Use of the areas for nonmotorized recreation is acceptable.

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Discourage recreational activities and uses, including overnight camping, and pack and saddle stock use.

Applicable Management Area
MA-G4 Research Natural Areas
MA-G15 Gray Butte Electronic Site

Standard and Guideline
Day use only. Allow no overnight camping.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
Recreation

Standard and Guideline
Allow recreational uses that are compatible with utility corridors. These areas will provide roaded, modified recreational opportunities.

Applicable Management Area
MA-G16 Utility Corridors

Practice
Developed

Standard and Guideline
Encourage and support State program of providing high quality developed recreational facilities.

Applicable Management Area
MA-G12 Cove Palisades State Park

Standard and Guideline
Allow no developments.

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Develop no sites in riparian areas.

Applicable Management Area
MA-G9 Riparian

Standard and Guideline
Develop trailheads at road closure points on Road 6360, Geneva overlook, and along Roads 63 and 6380.

Applicable Management Area
MA-G8 Squaw Creek
Practice
Facilities

**Standard and Guideline**
Develop facilities to meet user demand in line with the carrying capacity of the area.

Provide for boating, camping, picnicking, swimming and fishing uses.

**Applicable Management Area**
MA-G11 Haystack Reservoir

---

**Standard and Guideline**
Develop no interpretive or demonstration facilities.

**Applicable Management Area**
MA-G4 Research Natural Areas
**Standard and Guideline**
Develop facilities such as staging areas for ORV users, horse camps, and trailheads to meet user demand, but not exceed the carrying capacity of the area. Allow overnight camping at designated areas.

**Applicable Management Area**
MA-G1 Antelope Winter Range
MA-G3 General Forage

---

**Practice**
**Interpretation**

**Standard and Guideline**
Pursue opportunities for interpreting natural resources, resource management, historical points of interest, scenic views of the Cascades, etc. This may include such things as on-site facilities, interpretive trails, or self-guided motor tours.

**Applicable Management Area**
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range
MA-G3 General Forage
MA-G11 Haystack Reservoir

---

**Standard and Guideline**
Avoid publicity that would attract the public to the areas.

**Applicable Management Area**
MA-G4 Research Natural Areas

---

**Practice**
**Trails**

**Standard and Guideline**
Utilize the existing paths into the canyon as trails, and improve these trails as necessary to protect soil and watershed.

**Applicable Management Area**
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek
MA-G13 Lake Billy Chinook View Area
Standard and Guideline
Provide trailhead facilities as needed to support a coordinated trail system connecting the Grassland, the Ochoco National Forest, and other areas of central Oregon.

Applicable Management Area
MA-G11 Haystack Reservoir

Standard and Guideline
Allow existing trails to remain as long as the RNA objectives are not compromised.

Construct no new trails unless needed for research purposes.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Maintain and improve the existing trail to provide for wheelchair access. Expand the trail system as needed to enhance other recreational and interpretive opportunities.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
Standard and Guideline
Relocate trails to avoid wet areas.

Applicable Management Area
MA-G9 Riparian

Standard and Guideline
Construct & maintain trails to standards suitable for type and amount of use. Maintain trails to prevent resource damage and provide for user safety. Emphasize reconstruction of existing trails rather than construction of new trails. Develop multiple use trails whenever possible. Encourage use of volunteers to assist with trail construction and maintenance.

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range
MA-G3 General Forage

Practice
Off-Road Vehicles (ORV's)

Standard and Guideline
No motorized use allowed.

Applicable Management Area
MA-G4 Research Natural Area
MA-G5 Juniper Old Growth
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G8 Squaw Creek

Standard and Guideline
Encourage ORV's on designated routes where such use will not conflict with other resources. Legally close ORV routes to standard vehicle traffic. Allow no cross-country travel, including snowmobiles, except for administrative and permittee purposes (such as maintaining range improvements or firefighting). Rehabilitate user-developed trails and areas. Utilize seasonal closures on certain designated routes. Discourage play areas.
ORV Trails: Provide designated trails which offer scenic vistas, resource interpretation, challenging terrain and a variety of difficulty levels and experiences. Trail layout and design will be done in a manner to protect the resources. Install cattleguards at locations where trails cross a fenceline. Utilize topography, fences and buffers to isolate users from private lands and mitigate existing problems.

**Applicable Management Area**
MA-G3 General Forage
MA-G14 Dispersed Recreation

**Standard and Guideline**
Motorized use restricted to designated routes.

**Applicable Management Area**
MA-G9 Riparian

**Standard and Guideline**
No motorized use from Nov. 15 - March 31. Motorized use restricted to designated routes April 1 -Nov. 14.

**Applicable Management Area**
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range
MA-G11 Haystack Reservoir
MA-G13 Lake Billy Chinook View Area

**Standard and Guideline**
Allow no vehicles off roads, except for permittee or administrative purposes.

**Applicable Management Area**
MA-G10 Rimrock Springs Wildlife Area
Scenic Resources

Grassland-Wide Standards and Guidelines

Manage for the visual quality objectives (VQO's) listed for each management area.

Where natural catastrophes such as large wildfires, insect epidemics, or windthrows occur, management activities may differ from stated visual quality objectives.

In areas of the Grassland managed for a Visual Quality Objective of “modification” or “maximum modification,” be sensitive to the needs of the viewing public. Use cost-effective visual management techniques while meeting the emphasis of the management area. Examples of these techniques may include the construction of facilities, roads, and other physical structures with native materials, where possible.

Management Area Standards and Guidelines

Resource - Scenic Resources

Practice
Visual Quality Objectives (VQO's)

Standard and Guideline
Modification. Design vegetation manipulation projects for winter range habitat improvement to conform in size, shape and color to the natural terrain, to the degree practicable.

Standard and Guideline
Partial Retention.

Applicable Management Area
MA-G15 Gray Butte Electronic Site
Social and Economic

Grassland-Wide Standards and Guidelines

Human Resources
Minimize social, cultural, and administrative barriers to legitimate uses of the Grassland within the legal authority of the agency.

Maintain and implement an affirmative action plan.

Consider needs of the handicapped in the design of facilities and in other possible ways.

Conduct compliance reviews as required by the Title VI of the Civil Rights Act of 1964.

Inform the general public, including minorities and the underprivileged, of benefits they are eligible to receive from Grassland programs. Use techniques and the media best suited to increase awareness and participation.

Protect and preserve, for American Indians, access to and use of traditional sites, the possession of sacred objects, and the freedom to worship through ceremonials and traditional rites. Coordinate location and protection of these areas with representatives of the Confederated Tribes of the Warm Springs Indian Reservation. Consider the plans and policies of other Federal, State, local, and American Indian tribal governments in plan implementation.

Native American Rights
Consider and provide for the ceded land rights (treaty rights) of the Warm Springs Confederated Tribes in all Grassland related management activities.

Coordinate resource activities with the designated representatives of the Confederated Tribes of the Warm Springs Indian Reservation.
Grassland Plan
Chapter 4
Section 3

Soil

Grassland-Wide Standards and Guidelines

Address the potential for soil displacement, compaction, mass wasting, and surface soil erosion in project environmental analyses. Develop alternative management practices and mitigating measures when activities are likely to cause displacement, compaction, mass wasting, erosion, or long-term productivity losses.

Include provisions in contracts and permits to protect soils and soil productivity.

Surface Soil Erosion

Land management activities will be planned to achieve effective ground cover as defined by the following classes:

<table>
<thead>
<tr>
<th>Soil Resource Inventory</th>
<th>Minimum % Effective Ground Cover</th>
</tr>
</thead>
<tbody>
<tr>
<td>Erosion Hazard Class</td>
<td>First Year</td>
</tr>
<tr>
<td>Low</td>
<td>20-30</td>
</tr>
<tr>
<td>Moderate</td>
<td>30-40</td>
</tr>
<tr>
<td>Severe</td>
<td>50-60</td>
</tr>
<tr>
<td>Very Severe</td>
<td>60-75</td>
</tr>
</tbody>
</table>

Effective ground cover is defined as the basal area of perennial vegetation, plus litter and coarse fragments (greater than 2mm sizes), including tree crowns and shrubs that are in direct contact with the ground. Exceptions may occur where specific projects meet erosion control objectives without meeting the ground cover objectives stated above.

Recognize the sensitivity of certain areas and their potential to be adversely affected by management activities, and plan accordingly to minimize these effects. These sensitive areas include: riparian areas; wet meadows; springs, scablands and sensitive, threatened or endangered species habitat.

Scablands

Scablands are recognized as among the most fragile ecosystems on the Crooked River National Grassland. Damage to the soil and vegetation as a result of management activities is nearly impossible to mitigate. This is a result of their
having very shallow soils which are subject to severe water saturation and frost heaving during winter, thus making revegetation virtually impossible. For this reason, all management activities will be analyzed as to their affect on scablands prior to implementation. Use *Plant Associations of the Crooked River National Grassland*, Hopkins and Kovalchi, 1983, to identify scabland plant communities.

Other standards and guidelines for scablands are specific to certain types of activities, such as livestock grazing and road building, and are listed under those sections.

## Management Area Standards and Guidelines

### Resource - Soil

</tbody>
</table>
Transportation System

Grassland-Wide Standards and Guidelines

Planning

Plan transportation systems to support resource activities in the management areas, and to serve multiple resource needs rather than individual project proposals.

Roads and trails will be at the lowest density, which meets long-term resource needs. Where existing roads or trails are impacting water quality, steps will be taken to mitigate the problem.

Construct the planned transportation system to the required standards in order to meet the needs of the planned resource activities of the area. This standard will be such that repeated reconstruction to upgrade any given section of the system will be minimized during the planning period.

Update the Grassland Road Management Plan annually to identify development, traffic management, and maintenance priorities. Prepare and maintain road management objectives (RMO’s) for proposed and existing system roads, and identify roads not needed for future maintenance.

Coordinate with Jefferson County on management of their roads to complement Grassland uses.

Identify public usage roads in the Road Management Plan that require Forest Service jurisdiction to meet resource objectives.

Update the Grassland sign plan annually to reflect revisions in the Travel Plan (Appendix D).

Traffic Management

Manage traffic as needed to control access due to structural limitations of the road, safety, or constraints imposed by resource (coordination), such as those to meet wildlife needs or off-road vehicle (ORV) travel management needs.

Restrict traffic to a level that is compatible with the existing condition of a road if the road does not exist at an adequate and safe standard for the traffic expected to use it.

The adequacy and safety of the transportation system will conform to the Forest Service Manual and Handbooks

Utilize the full range of strategies for managing traffic, including prohibiting use on a seasonal or yearlong basis to eliminating all standard vehicle use for more than one year.
Allow ORV use only on roads where all standard vehicle use has been eliminated or on roads which have no current or planned future use where appropriate with other resources.

Sign traffic control devices (such as locked gates) to let users know why use is prohibited and for what period of time.

Recreation
Encourage ORV use only on roads where all standard vehicle use has been eliminated, or on roads which have no current or planned future use, where appropriate with other resources.

Reconstruct, operate and maintain access routes to developed sites, permitting low clearance (passenger car) traffic. However, public use may be seasonally discouraged, or restricted.

Prevent investment loss and resource damage during wet periods of the year by graveling local road access to historical dispersed recreation sites. Road access management strategies to the dispersed sites will generally be “accept” or “encourage” use by dispersed recreationists.

Construction and Reconstruction
Design, construct, and reconstruct roads according to standards based on the following criteria: resource management objectives, environmental constraints, safety, physical environmental factors, traffic requirements, traffic service levels, vehicle characteristics, road users, and economics.
Do not construct roads through the length of a riparian area. Roads crossing a riparian area will not alter stream or groundwater flow characteristics to a degree which will impact the riparian characteristics.

Design and maintain road drainage, to the extent possible, to eliminate any influx of sediment road runoff directly into stream channels.

Manage road construction activities to minimize the amount of unprotected soil surfaces when heavy rain or heavy surface runoff are most likely to occur.

Ensure that erosion control measures are completed prior to times of year when heavy rain or heavy runoff are normally expected.

Whenever practical, locate roads on areas with the lowest erosion hazard.

Ensure that temporary culverts or bridges are used where stream bottoms or banks would otherwise be damaged, and that these temporary structures are removed after use.

Roads which pass through high water table areas should be constructed in a manner which does not alter the flow characteristics of the groundwater.

Stream Crossings
Design and construct the transportation system to minimize the numbers of stream crossings.

Locate stream crossings and the approach alignment to minimize stream damage.

Protect bridge approach fills with riprap or wing walls.

Ensure adequate sizing of culverts or bridges to accommodate anticipated high streamflows and to allow fish passage.

Schedule stream crossing construction during low streamflow and/or outside fish spawning periods.

Do not permit stream crossings that will change floodplain or streamflow characteristics.

Maintain existing riparian communities both upstream and downstream from the crossing.

Visuals
Include parking areas and view points in road plans and designs where appropriate.

Locate material stockpiles out of site of the main travel route.

Meet visual objectives for the management area when locating, entering, or closing gravel pits or barrow areas.

Avoid locating roads in the visual foreground other than at junctions. Design roads to fit the topography, minimizing cuts and fills. Roads should not dominate the natural pattern of line, form or color.
Design and construct necessary road closures in visual management areas to blend with the natural characteristics of the landscape.

Road Operations and Maintenance
Operate and maintain all roads within available financing according to maintenance levels established in Road Management objectives and standards defined as follows:

<table>
<thead>
<tr>
<th>Minimum Maintenance Level</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Obliterated</td>
<td>No current or future use (36 CFR 261.5)</td>
</tr>
<tr>
<td>1 (Closed)</td>
<td>No current use, planned future use</td>
</tr>
<tr>
<td>2</td>
<td>High clearance vehicles</td>
</tr>
<tr>
<td>3,4,5</td>
<td>Low clearance vehicles</td>
</tr>
</tbody>
</table>

If funding is inadequate to maintain some roads at the intended maintenance level, maintain roads at a lower maintenance level, such as high clearance access (Level 2) to a closed level (Level 1).

Stabilize and re-establish vegetation on obliterated roads.

Ensure that necessary road and trail maintenance is performed on all runoff control and drainage structures (dips and culverts).

Provide for additional maintenance of road drainage and crossing structures during periods when unusual runoff is expected.

Ensure that appropriate traffic management is established to prevent the creation of pollution-generating conditions, such as deep wheel tracks in roads during wet weather.

Management Area Standards and Guidelines

Resource - Transportation Planning

Practice
Construction and Reconstruction

Standard and Guideline
Allow no road construction unless there are no reasonable alternatives. When essential, allow construction or reconstruction only between July 15 and January 31 to protect wildlife values (such as nesting).
Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Construct no new trails or roads unless they enhance RNA values, and only with the permission of the PNW director.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Construct no roads along the length of riparian system areas. Do not allow roads that cross riparian areas to alter stream or groundwater flow characteristics to a degree that will impact the riparian characteristics.

Design, construct, and maintain road drainage to eliminate the runoff of sediment into riparian areas.

Where existing roads are impacting water quality, mitigate the problem.

Design and construct the transportation system to minimize the number of stream crossings.

Protect bridge approach fills with riprap or wing walls.

Install culverts or bridges that are adequate to accommodate high stream flows, and designed to allow fish passage.

Accomplish stream crossing work only during periods of low stream flow, and when fish are not spawning.

Applicable Management Area
MA-G9 Riparian

Practice
Operations and Maintenance

Standard and Guideline
Generally, maintain roads for high clearance vehicles (Level 2). County roads are generally maintained for low clearance vehicles.

Applicable Management Area
MA-G1 Antelope Winter Range

Standard and Guideline
Generally, maintain roads for low clearance vehicles (Level 3, 4, 5). However, some roads may be maintained only for high clearance (Level 2).
**Applicable Management Area**
MA-G3 General Forage
MA-G14 Dispersed Recreation

---

**Standard and Guideline**
Close all roads in the management area to public use year-round, allowing only administrative and permittee use.

**Applicable Management Area**
MA-G6 Crooked River Recreation Area
MA-G7 Deschutes River Scenic Corridor
MA-G15 Gray Butte Electronic Site

---

**Standard and Guideline**
Maintain roads for low clearance vehicles (Level 3).

**Applicable Management Area**
MA-G11 Haystack Reservoir

---

**Standard and Guideline**
Generally, maintain roads for high clearance vehicles (Level 2).

**Applicable Management Area**
MA-G2 Metolius Deer Winter Range

---

**Standard and Guideline**
Maintain trailhead for passenger car traffic.

**Applicable Management Area**
MA-G10 Rimrock Springs Wildlife Area

---

**Standard and Guideline**
Manage road construction activities and complete erosion control measures to prevent runoff from unprotected soil surfaces when heavy rains are expected.

Ensure that erosion control measures are completed prior to times of year when heavy rain or runoff are normally expected.

Whenever practical, locate roads in areas with the lowest erosion hazard.

Where roads cross streams, use temporary culverts or bridges in places where stream bottoms or banks would likely be damaged. Remove these temporary structures when no longer needed.

Maintain runoff control structures annually.
Applicable Management Area
MA-G9 Riparian

**Standard and Guideline**
Transportation systems needed to support the installation and maintenance of structures associated with utility corridors is generally done by utility company.

Applicable Management Area
MA-G16 Utility Corridors

**Standard and Guideline**
Maintain existing roads and allow no further development. (The present ford on Road 6360 will be maintained at the present development level).

Applicable Management Area
MA-G8 Squaw Creek
MA-G13 Lake Billy Chinook View Area

**Practice**
Traffic Management

**Standard and Guideline**
Control access as needed to enhance big game winter range and support other resource objectives (see Travel Plan, Appendix D).

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G2 Metolius Deer Winter Range

**Standard and Guideline**
Transportation within the park boundary is the responsibility of the State.

Applicable Management Area
MA-G12 Cove Palisades State Park

**Standard and Guideline**
Close roads seasonally in specific areas: deer hunting season, September 20 - October 20; protection of soil and water for winter closure, December 1 - March 30.
Applicable Management Area
MA-G3 General Forage

Standard and Guideline
Control access to protect old growth habitat (see Travel Plan, Appendix D).

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Allow only administrative and permittee traffic.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area

Standard and Guideline
Close Road 6360 seasonally to protect deer winter range.

Close all other roads in the management area to public use year-round, allowing only administrative and permittee use.

During the period that Road 6360 is open, keep Road 6370 open to a trailhead to Alder Spring that is to be constructed.

Applicable Management Area
MA-G8 Squaw Creek

Water

Grassland-Wide Standards and Guidelines
Meet or exceed water quality standards for waters of the State (Oregon Administrative Rules, Chapter 340-41) through application of Best Management Practices (BMP's). The key beneficial uses that BMP's are designed to protect are fish and water for domestic use (see FEIS Appendix G).

Use the existing process to implement the State Water Quality Management Plan on lands administered by the Forest Service (including the National Grassland) as described in a Memorandum of Understanding (MOU) between the Oregon Department of Agriculture and the Forest Service (2/79), and "Attachment A" referred to in this MOU (Implementation for Water Quality Planning on National Forest lands in the Pacific Northwest 12/78, Appendix F).
The following standards and guidelines apply to all management areas where water resources exist, and where management activities have potential for degradation of water quality.

**Water Quality**

Meet State standards for temperature, turbidity, and waste discharge.

**Temperature**

The requirements for shade along streams will generally correspond to provisions for more than 80 percent of the surface shaded. Where this cannot be attained, 100 percent of the potential for shade is the standard.

Shade requirements may be reduced in cases where management is necessary to sustain a thrifty (fast growing) community of shade providing species over time (e.g., in the case of local infestation or disease, or for managing for future shade in a decadent stand), but activities may not result in an increase in temperatures above the limits specified.

**Deschutes River, Crooked River, Squaw Creek and Associated Tributaries**

Existing temperatures at or above 58°F will not be increased.

Temperatures at or below 56°F may be raised a maximum of 2°F.

Where stream temperatures exceed 58°F, management activities will include objectives for reducing temperatures to levels that will improve fish habitat capability.

**Turbidity**

Cutbanks should not exceed an average of 20 percent for any given stream drainage.

Allow no more than 10 percent cumulative increase in stream turbidity. Short-term deviations from this standard to accommodate emergency or other legitimate activities will comply with state requirements for notification and approval.

**Waste Disposal**

Dispose of waste effluents (e.g., fuels, solvents, and pesticides) in a manner that will prevent contamination of surface or subsurface water.

**Project Planning**

Allow no management activities in and around Class III streams that contribute to the deterioration of water quality below standards set for downstream Class I and II streams. Some short-term temperature and/or turbidity increases may be allowed, providing the standards for Class I and II streams continue to be met. Consider the potential for cumulative impacts.
Develop specific objectives for the management of riparian areas through the NEPA process for all projects that could impact water quality. Include in the environmental assessment:

- Stream classification.
- Site specific topographic, soil, channel, and vegetation characteristics.
- Water quality standards and goals.
- Fisheries habitat.
- Analysis of the cumulative effects of individual management activities.
- The opportunities management activities present in correcting existing problems within a drainage.
- Other resource objectives, as appropriate.

Highest priorities for treatment are existing areas where water quality is being adversely impacted.

Give preferential consideration to riparian-dependent resources over other resources in case of unresolvable conflicts.
Floodplains
Consider the presence of potential (Executive Order 11988) inventoried floodplain within the project area in project environmental assessments.

Do not locate major structures, roads, or other facilities within floodplains unless no feasible alternative sites exist outside floodplains.

Allow projects causing short-term impacts on floodplain values only if specific mitigation measures designed to minimize the impacts are documented in the project environmental analysis. Restore natural floodplain characteristics after the activity has ceased.

Wetlands
Discuss the presence of potential impacts to riparian areas in all project-level environmental assessments.

Vegetation and ground cover requirements:
Where site potential and topographic factors permit, manage riparian areas to provide the shade necessary to meet stream temperature goals.

Maintain upper streambanks in a stable condition along at least 80 percent of the length of a stream.

Retain at least 80 percent of the potential ground cover in grass-forb riparian communities. Also, retain at least 80 percent of the potential tree or shrub cover in riparian areas dominated by trees or shrubs. In riparian areas with mixed layers, the cover requirement may be met by taking credit for the effective cover provided by all vegetative layers of the riparian community including shrubs, tree understories, and the dominant overstory. Consider the mitigating effect of stream size and orientation as well as surrounding topography when determining the amount of cover that may be removed.

Wildlife and Fish

Grassland Standards and Guidelines

Management Indicator Species

General
Determine if a species' use of habitat is incidental or essential. If it is determined to be essential habitat (e.g. roosting sites), protect it from adverse modification through curtailment of conflicting activities, modification of activities, seasonal restriction of activities, or avoidance of the area. For bald eagles, consult with the
Endangered Species Branch of the Fish and Wildlife Service on proposed actions that may affect the species.

For newly discovered habitat, evaluate through the environmental analysis process to determine if habitat is essential. If so, amend the Plan to reflect this situation.

Close areas to vehicles during hunting season in cooperation with the Oregon Department of Fish and Wildlife.

**Common Flicker (Old Growth Juniper)**

On juniper dominated lands, maintain old growth juniper habitat comprising 40 acre units (may be composed of scattered stands as small as five acres in size located no more than 1/8 mile apart), generally no more than 5 miles apart.

**Rainbow Trout**

Provide habitat by managing as required in the Riparian management area prescription.

**Threatened, Endangered, and Sensitive Wildlife Species**

Cooperate with State and Federal fish and wildlife agencies in developing recovery plans for threatened or endangered wildlife species. Recovery plans take precedence over other management direction.

Consult with the U.S. Fish and Wildlife Service when conflicts between project activities and habitat needs cannot be resolved, or when uncertainty exists.

Maintain inventories of essential or critical wildlife habitats including their locations and distribution.

Inventory and protect sensitive plant species and their habitat(s). Possible taxa found on the Grassland are: Astragalus howellii (not confirmed), Collomia macrocalyx, and Oryzopsis hendersonii.

Incorporate plant association information (Hall, 1973, Hopkins and Kovalchik, 1983) and management implications into project design.

Maintain contacts with Federal, State, and other agencies, groups, and individuals concerned with the management of threatened, endangered, and sensitive plant and animal species. Consult with the Oregon Department of Fish and Wildlife, Oregon Natural Heritage Data Base and U.S. Fish and Wildlife Service for technical assistance in developing species management guides and in determining viable population levels.

Review location records, available habitat, and other information during environmental analysis of each project activity to determine whether known or suspected locations of sensitive plant species or their habitat occur.

Document findings when no suitable habitat or reported locations of sensitive plants are identified, and no further investigation will be required.
Perform a field reconnaissance when suitable habitats or reported locations are suspected to occur in the area of influence of the project, to more precisely verify the presence, abundance, and distribution of the sensitive species. If the search is conducted during a season of the year when positive identification is probable, and no listed species are found, document this fact and no further investigation will be needed.

Determine actual distribution and current status of listed plant species if they are found in the project influence area. Informal consultation with the Endangered Species Branch of the Fish and Wildlife Service will be initiated if the species is Federally listed. Curtail or modify the proposed project if it would jeopardize the existence of the species.

Spell out identified safeguards in the environmental analysis and project plan; project personnel will be fully responsible for being aware of and implementing these safeguards. Supervisors of the activity must assure that actions which jeopardize the listed species do not occur.

Defer actions which may affect habitat for Federally listed endangered or threatened species, if they can not be avoided, until a formal consultation with the Endangered Species Branch of the Fish and Wildlife Service is completed to determine a course of action.

Possibly conduct a full botanical investigation of the species involved in cases where other high values or uses would be foregone if the proposed activity were modified or deferred. Develop management guidelines that will make possible an assessment of the significance of the specific population involved. Determine an appropriate course of action based on these findings and consultation with appropriate state and federal agencies.

Coordinate with the Native Plant Society of Oregon to exchange information on local plant distributions and status.

**Other Species**

**Mule Deer**

Manage mule deer winter range to attain a 40/60 cover/forage ratio. Thermal cover units should generally be larger than 20 acres.

Provide forage sufficient to maintain current State management objectives for mule deer.

Manage the transportation system to provide optimum habitat effectiveness. Utilize permanent and seasonal closures as needed during the hunting season and on the winter range to achieve this standard (see Travel Plan, Appendix D).
Antelope

Allow antelope populations on the Grassland to increase until either significant resource conflicts or private land damage occurs. Estimated carrying capacity for wintering antelope is 300-350 animals. The Oregon Department of Fish and Wildlife is the lead agency in controlling animal numbers.

Raptors

Protect active raptor (bird of prey) nests from human disturbances until nesting, feeding, and fledgling are completed. Provide protection of nest sites and nesting habitat sufficient for the species involved.

Bald and Golden Eagles

Protect nesting sites and roosting sites used in conjunction with nesting sites, as prescribed in the “Act for Protection of Bald and Golden Eagles” (ref. title 50 CFR, USC 668-668d).

Nesting Sites

Eagle nesting territories are divided into primary and secondary management zones.

Primary

The boundary of the primary zone shall not be less than 20 chains from the nest.

Human activities should be controlled during the critical period. The critical period is the time between arrival of adults at the nest site and three weeks after the fledgling of any young. The critical period will usually fall between March 1 and August 15.

Secondary

The purpose of this zone is to further minimize disturbance.

The size of the secondary zone will be determined by local topography and resulting visibility from the nest. It shall lie outside the primary zone and be approximately circular with a minimum boundary of 40 chains from the nest.

Human activities into the secondary zone should be restricted during the critical period.

Roosting

Within 1/2 mile (40 chains) of existing nests, save three to five old growth trees for potential roost and perch trees during the breeding season.
Hawks and Owls, Except Prairie Falcons

Nesting Sites
Nesting areas are divided into primary and secondary zones.

**Primary**
The boundary of the primary zone should not be less than 5 chains (330 ft.). The management objective for this zone will be to maintain the present habitat characteristics.

The critical period, during which human activities should be restricted, will usually fall between March 1 and August 1.

**Secondary**
The boundary of the secondary zone should be an additional five chain radius beyond the primary zone (total 10 chain radius). In this secondary zone, modified treatments will be required. “Modified” means intermediate between that required in the primary zone and that normally prescribed outside of the whole protection zone.

The critical period is the same as for primary zone “Hawks” above.

Prairie Falcons
Carefully evaluate activities having the potential to alter or disturb cliffs, talus, or cave habitats.

Nesting Sites

**Primary**
The boundary of the primary zone should not be less than five chains (330 ft.). Maintain the present habitat characteristics.

Restrict human activities during the critical period, usually March 1 to August 1.

**Secondary**
The boundary of this zone should be an additional 15 chains beyond the primary zone. The management direction for this zone will be a modified treatment, and full treatment beyond the secondary zone.

Critical period: March 1 to August 1.

Species Associated with Dead and Downed Logs
Down dead log requirements for wildlife are expected to be met through attrition of standing snags as they fall.

Species Associated with Various Plant Communities and Successional Stages
Provide diversity by maintaining representative portions of all native plant associations and various successional stages represented in an area through time
Species Associated with Springs and Bogs
Identify and evaluate seeps, springs, bogs, other small (less than 10 acre) wet areas, and any other unique habitat on a project level basis, while providing appropriate protection.

Introduced Species
Evaluate proposals for introducing wildlife through the NEPA process. Coordinate with the Oregon Department of Fish and Wildlife.

| Standard and Guideline | Manage the area north of the Hay Creek road at a 20/80 cover/forage ratio by maintaining the present cover patches. The rest of the General Forage Management Area will be managed at a 40/60 cover/forage ratio. |
|------------------------| The 40 percent cover component will have a range of juniper canopy cover from 15 percent to 30 percent, and will continue to be manipulated to maintain the target cover/forage ratio over time. |
|                       | Cover areas will not be allowed to deteriorate to the point of poor range condition or unhealthy watershed condition. |
Applicable Management Area
MA-G3 General Forage

Standard and Guideline
Provide old growth juniper stands of 40 acres minimum size distributed a maximum of five miles apart. The majority of the trees should be large with hollow centers.

Applicable Management Area
MA-G5 Juniper Old Growth

Standard and Guideline
Manage to provide optimum habitat for deer use on winter range.
Manage 40 percent of the total area in cover. Maximum distance from cover to any point in a forage area should not exceed 400 feet.
Treat isolated cover-producing lands to produce the best balance of cover over time when the general area inherently has a low cover production potential.
Give top priority to providing high quality forage, by fall greenup, for deer.

Applicable Management Area
MA-G2 Metolius Deer Winter Range
MA-G8 Squaw Creek

Standard and Guideline
Allow no exotic species to be introduced.
Permit the reintroduction of former native species if not in conflict with other objectives of the RNA.
Control of excessive animal populations may be considered where such populations threaten the RNA objectives.

Applicable Management Area
MA-G4 Research Natural Areas

Standard and Guideline
Manage for wetland related species.
Use prescribed fire or controlled livestock grazing to maintain productive habitat.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area
Wildlife and Fish

Standard and Guideline
Manage habitat for maximum populations of brook and rainbow trout where that potential exists.

Manage riparian vegetation to provide cover for upland game birds.

Applicable Management Area
MA-G9 Riparian

Standard and Guideline
See standards and guidelines for adjacent management areas.

Applicable Management Area
MA-G16 Utility Corridors
MA-G14 Dispersed Recreation

Habitat Improvement

Standard and Guideline
Permit habitat improvements that are compatible with the primary objectives of the management area.

Applicable Management Area
MA-G1 Antelope Winter Range
MA-G4 Research Natural Areas
MA-G5 Juniper Old Growth

Standard and Guideline
In areas of extensive juniper encroachment, remove juniper in irregular-shaped blocks to work toward an optimum 40/60 cover/forage ratio.

Permit other habitat improvements that are compatible with the primary objectives of the management area.

Applicable Management Area
MA-G2 Metolius Deer Winter Range
MA-G3 General Forage
MA-G8 Squaw Creek
Standard and Guideline
Use habitat improvements to achieve the desired future condition of the area.

Applicable Management Area
MA-G10 Rimrock Springs Wildlife Area

Standard and Guideline
See standards and guidelines for adjacent management areas (except for prescribed burning).

NOTE. The Grassland-wide standards and guidelines for Air Quality, Biological Diversity, Old Growth, and Social and Economic resources apply to all management areas as appropriate with no management area standards and guidelines. This table will assist the reader in locating the applicable standards and guidelines for each management area by referencing the applicable pages (only the page number suffix is listed, all are preceded by a 4.)
Chapter 5

Implementation of the Grassland Plan
Chapter 5

Implementation

Introduction

This chapter explains how management of the Crooked River National Grassland will move from the current direction and situation into Alternative I. Implementation can be influenced by previous management activities and objectives, project analysis, budget, monitoring and evaluation, and when necessary, the required amendment process.

Implementation will require a transition from an existing management program with a "pre-allocated" budget and accomplishment targets to a new management program, represented by Alternative I, with budget, goals, and objectives based on identified issues and concerns. The Plan establishes the management direction for the Crooked River National Grassland for the next 10 to 15 years. In doing so, it conforms to existing laws, regulations, and policies, including those found in the Forest Service Manual and Handbooks, and the Regional Guide.

Project Scheduling

An initial schedule of proposed projects is contained in the appendices of this document. These activities represent possible projects and time frames from which annual work programs (dependent on approved funding) are developed. The listing of projects and schedules for a ten year period are maintained by unit managers. Listings will routinely change as projects are implemented or are removed from the lists for other reasons, and as new projects take their place. Projects are implemented in response to public demand, planned outputs and the annual budgeting process.

Budget Proposals

Multiyear budget proposals that identify funding needed to implement the scheduled outputs will be developed. Upon approval of a final budget for the Grassland the annual program of work is finalized and carried out. The annual program is an incremental implementation of the management direction in this Plan. Outputs and activities in individual years may vary from those shown in the Management Objectives (Chapter 4, Section 1) and schedules (Appendix A), depending on actual budget, but will progress toward the desired future condition.

The rate of progress is dependent to a large extent upon funding to support activities needed to achieve plan objectives. Table 5-1 compares the projected funding level that will be required to implement Alternative I to funding levels received by the Grassland from 1985 to 1989.

Environmental Analysis

Projects and activities are subject to analysis under the National Environmental Policy Act (NEPA) process before they can be implemented. Depending on expected environmental consequences, a categorical exclusion, environmental assessment, or environmental impact statement may be prepared. All documents, including categorical exclusions, will be available for public review.

1/ Implementation will begin in fiscal year 1990. The program budget for fiscal year 1992 scheduled for completion in late 1993 will be the first to reflect the final plan. Budget levels requested during the draft planning period will be amended to support our final document.

2/ Includes $200,000 in Recreation Construction.
Monitoring and Evaluation

Monitoring is the means of measuring and evaluating the effectiveness of the Grassland Plan implementation. Monitoring provides quantitative and qualitative information on the progress and results. It is a means to determine how well assumptions used in preparing the Plan reflect actual conditions, how well objectives of the Plan are being met, and the appropriateness of the management standards and guidelines. Monitoring may lead to changes in management practices, or provide a basis for minor adjustments, amendment, or possible revision of the Plan.

Monitoring is intended to help keep the Grassland Plan dynamic and responsive to changes. When a situation is identified as being outside the limits of acceptable variability, appropriate amendment, revision, or other changes may be made. Monitoring and evaluation have a distinctly different purpose and scope. Monitoring consists of gathering data, observations, and information. During evaluation, the data and information are analyzed and interpreted. This process provides information necessary to determine if planned conditions or results are being attained and are within the intent of the Plan, and if not, why.

It will provide information to help determine, for example:

- whether laws, regulations, and policies are being followed, including those found in the Regional Guide, Plan standards and guidelines, the Forest Service Manual and Handbooks;
- whether the Grassland Plan responsively addresses the issues, concerns, and opportunities in a publicly acceptable manner;
- whether management prescriptions are producing the predicted or desired environmental results,
- if costs of implementing the Plan are within projected limits;
- if projected outputs are being produced,
- whether there are new issues and concerns not adequately addressed by the Plan.

There are a number of monitoring systems currently in place to comply with administrative and legal responsibilities. Examples include MAR, PAMARS, RAMIS, TSpIRS, STARS, NIRP, etc. Additional examples may be found in Forest Service Handbook 1309.14 Forms and Reports.

Grassland Plan monitoring does not replace or substitute these systems, but rather complements them by addressing specific issues and concerns identified through the planning process and providing additional information for evaluating the effectiveness of the Plan.

Table 5-3 outlines monitoring actions, including a number of ongoing monitoring items that will help evaluate how implementation is progressing. Following the decision matrix in Figure 5-1, evaluation of the monitoring data will lead to decisions of the following types:

1. Continue practice, no change necessary.
2. Refer the problem to the appropriate Forest officer for corrective action.
3. Modify the management practice through Plan amendments.
5. Revise output schedules.
6. Revise unit output costs.
7. Revise the Plan.

The first step in monitoring will be comparing the Plan to the annual budget received by the Grassland. This will include a review of Grassland capabilities to implement the prescriptions in the Plan, cost comparisons and output levels. Variances beyond a threshold of 10 percent will be presented to the Ochoco National Forest Management Team for decision. Resolution may be accomplished through allocation adjustments, requests for change to the Regional Office or other adjustments or amendments. Figure 5-2 shows schematically how the process proceeds.
Amendment and Revision Process

The Grassland Plan incorporates legal mandates, professional judgement and the public's stated concerns into a future vision of the Grassland. It charts a path for getting there by developing management goals and objectives and translating them into management direction in the form of standards and guidelines for management areas on the Grassland National Grassland planning is a dynamic process, and the products -- Grassland Plans -- are similarly dynamic. Grassland Plans can and should be modified if conditions warrant. As management goals are applied on the ground or as new information is learned about resources, the Plan's goals and objectives, or activities the goals generate, may no longer be appropriate. In such instances, activities may be tailored to fit the resource, or planning objectives as stated in the Plan may be amended. Plans do not apply direction in site-specific management activities. It would be unrealistic and wrong to try to identify, analyze and schedule the myriad projects or activities that occur on a National Grassland. Instead, this type of site-specific planning occurs at the project-level planning stage, such as allotment management planning.

This Grassland Plan may be changed either by an amendment or a revision. Such changes may come about as a result of the monitoring process or project analysis (Figure 5-2). An amendment may become necessary as a result of different situations. They can include:

- recommendations of the Interdisciplinary Team based on their review of monitoring results;
- the determination that an existing or proposed permit, contract, cooperative agreement, or other instrument authorizing occupancy and use is not consistent with the Grassland Plan, but should be approved, based on project level analysis;
- changes in proposed implementation schedules needed to reflect differences between funding levels assumed in the plan and funds actually appropriated,
changes necessitated by resolution of administrative appeals;
changes to correct planning errors;
changes made necessary by altered physical, social, or economic conditions.

Based on an analysis of the objectives, guidelines, and other aspects of the Grassland Plan, the Forest Supervisor shall determine whether a proposed amendment would result in a significant change to the Plan. If the change is determined to be significant, the Forest Supervisor shall follow the same procedure as that required for development and approval of a plan. If the change is determined not to be significant, the Forest Supervisor may implement the amendment after appropriate public notice and compliance with NEPA (see Figure 5-3).

The Regional Forester will approve significant amendments, and the Forest Supervisor will approve "not significant" amendments. The determination of significance will be documented in a decision notice and would be appealable under 36 CFR 217.

With respect to revision, the NFMA requires revision of the Grassland Plan at least every 15 years. However, it may be revised sooner if physical conditions or demands on the land and resources have changed sufficiently to affect overall goals or uses for the entire Grassland. If a revision becomes necessary, the procedures described in 36 CFR 219.12 will be followed. The Chief, however, must approve the scheduling of such revision.
Consistency with Other Instruments

This Grassland Plan serves as the single land management plan for the Crooked River National Grassland. All other land and resource management plans are replaced by the direction in this Plan; a list of plans revised, superseded, or updated by this Plan are shown in Table 5-2.

All outstanding and future permits, contracts, cooperative agreements and other instruments for occupancy and use of lands will comply with direction in the Grassland Plan as soon as practicable, subject to the valid existing rights of the parties involved. This will occur generally within three years of the date of implementation of this Plan.

Recreation

All leases and Memoranda of Understanding between the Ochoco N.F. and the State of Oregon, Bureau of Reclamation, or other agencies, will be consistent with Grassland Plan direction at the first reissuance of said leases and Memoranda following plan implementation.

Wildlife and Fish

Within two years after implementation, habitat survey schedules and habitat improvement project schedules will be prepared for a five-year period.

Range

Existing Allotment Management Plans and Grazing Permits will be in compliance with Grassland Plan direction on the first update or reissuance following Plan Implementation.

In implementing the Grassland Plan, any necessary adjustments between existing permitted livestock numbers and plan direction will be made by evaluating management direction for allotments, and determining if a change in management intensity for the allotment is necessary. Factors influencing this decision will include: permit status, condition of improvements, funds available, priority needs on other allotments, and ability to meet standards and guidelines in this Plan.

Lands

All development and management plans for facilities will be consistent with Plan direction as soon as practicable, subject to valid existing rights of outstanding permits, contracts, and cooperative agreements.

Minerals

New mineral leases, permits, contracts, and operating plans will be evaluated for consistency with the Grassland Plan as they are received or proposed. Existing permits and operating plans will be reviewed for consistency with Plan standards and guidelines. Modifications of these permits will be required only when authorized by law or regulation. Operating plans may be modified on a case-by-case basis if over-riding resource considerations are present.

Since the Forest Service has no authority to modify stipulations attached to existing mineral leases, modification will be recommended to the proper agency when found necessary.

MONITORING PLAN NOTES

This monitoring plan is intended to be a dynamic plan subject to revision as the Forest and Grassland Plans are implemented. The process to update and, or amend the plans is iterated in figure 6-2, p ___

Definitions of monitoring plan elements

- Monitoring Item - Primary resource or activity to be monitored
- Action or Effect to be Monitored - A specific statement of what will be checked
- Units of Measure - A quantifiable amount related to the action or effect
- Variability Threshold - Levels which, if exceeded, may trigger the need for re-evaluation of the Forest Plan
- Data Precision - How exact or accurate the measurement, rated high, moderate or low (H, M, L)
- Reliability - Expected probability that information acquired through sampling will reflect actual conditions. Rated high, moderate or low (H, M, L)
- Suggested Methods - Statement of how monitoring will be accomplished
- Who Will Monitor - Identifies Program Manager in charge of implementation of monitoring, data collection, analysis, evaluation, and report preparations
- Monitoring Frequency - The scheduling of sampling for the item to be monitored stated in years or parts of years
- Data Location - Indicates where the collected monitoring data, analysis and evaluation reports for the item monitored are accumulated
- Estimated Annual Cost - This cost includes existing and planned monitoring items
- Action Indicated - Codes related to types of procedures implemented when variability thresholds are exceeded

FOOTNOTES

1/ GIS - Geographic Information System The monitoring plan recognizes that when GIS is implemented on the Forest and Grassland, it will provide the base data upon which monitoring will rely. In the interim, the existing data bases will be used.

3/ Cross section and pool riffle ratio - Use standard inventory procedures outlined by Hankin and Reeve’s stream survey process (Estimating Total Fish Abundance and Total Habitat Area In Small Streams Based On Visual Estimation Methods, Hankin, D G & Gordon H Reeve, Canadian Journal of Fish & Aquatic Science, Vol 45, 1988)

4/ Utilization levels will be incorporated into allotment management plans

5/ Recreation Opportunity Spectrum

6/ Habitat effectiveness index - The HEI model, using cover, forage relationships, vegetation trends and road density, measures habitat capability for big game at a point in time. The HEI provides trend information over time to determine whether habitat capability objectives are being met.

| FY00 | T 13S, R 13E, Sec 7, 8, 17, 18, 19, 20, 23, 30 | Opal City |
This completes a management plan on every allotment. At this point, revisions will be started on allotments as they are needed. Revisions will be scheduled based on changes found to be needed during monitoring of existing allotment management plans, or changes in permittees on an allotment who have a different type of operation. It is estimated that one to two revisions per year will be done.

Metolius Deer Winter Range - In order to produce optimum deer winter range habitat, juniper must be cut and burned in patches to bring the cover/forage ratio to 40% cover and 60% forage. To meet this objective by the end of the first decade, 256 acres per year must be cut and burned, 51 acres, or 20% of those acres, will be seeded to grass species. After the first decade, 200 acres per year will need to be cut and burned to maintain a sustained 40/60 cover/forage ratio. 40 acres, or 20% of those acres, will be seeded to grass species.

Antelope Winter Range - 800 acres every other year will be treated with fire to maintain optimum antelope winter range. This will keep shrub species at or below 24 inches in height. Patches of juniper and taller shrubs will be maintained for overall diversity.

Ponderosa Pine Area - Cut juniper and underburn 70 acres per year for the first five years as per direction in existing environmental assessment.

Riparian and Wildlife - The following schedule lists all the riparian and wildlife projects that are left to be done on the Grassland. They are scheduled to be done between 1990 and 1993. After 1993, maintenance will be nearly all that will be necessary.

(W) = wildlife
(R) = riparian

Appendix B

Land Ownership Plan

Because the existing land ownership pattern may not be optimum for accomplishing the Grassland's goals and objectives, a land ownership plan has been devised. This plan identifies which lands should be retained, disposed of, or acquired to achieve the best ownership pattern.

The fact that a parcel of land has been identified for acquisition in this plan does not guarantee that the parcel will be acquired in a given period of time. The private landowner must be willing to either participate in a land exchange involving the parcel, or to donate the parcel; there are no plans to purchase or condemn lands. In addition, in most cases, the Grassland will not acquire lands containing significant improvements.

The objective of the land adjustment program is to attain an optimum land ownership pattern that provides for resource uses that best meet the people's needs and that reduces administrative costs. A consolidated land ownership pattern helps accomplish these objectives. Adjustments will be accomplished through exchanges or donations. It is unlikely that private lands will be purchased.

Lands within the Grassland boundary have been grouped into the following ownership categories:

1. Areas where Congress has directed the Forest Service to retain Federal lands and to acquire non-Federal lands for a designated purpose. The Deschutes Scenic River falls into this category.

2. Areas where National Grassland ownership is necessary to meet management objectives. Federally owned lands will be retained, and non-Federal lands will be acquired as the opportunity or need arises.

3. Lands allocated for commodity production, where the lands would be managed to provide similar types of output regardless of ownership. Federal lands may be retained, or they may be used to acquire lands in Categories 1 and 2. However, lands in this category will not be disposed of if that would result in a breach in a solid block of Federally-owned land. Private lands within this category may be acquired in order to consolidate Federal ownership.

4. Small, isolated blocks of National Grassland lands which do not contain special features, and which are expensive and difficult to manage. These lands will be used to acquire lands in Categories 1, 2, and 3. Disposal of Category 4 lands will have priority over the disposal of lands in Category 3.

5. Areas where more intensive study and planning are necessary to determine the optimum land ownership patterns. Federal lands in Cove Palisades State Park are included in this category.

The management areas are classified as follows:

<table>

N.G.: Crooked River National Grassland

- **D** = Determined to be present
- **S** = Suspected to be present
Appendix D

Travel Plan

Process

Various laws, regulations, and Executive Orders recognize on-road and off-road uses as legitimate activities on national grasslands and forests.

The Transportation Planning Handbook, FSH7709.55 contains procedural direction on access and travel management. The objective in the handbook states, "... identify and document recreational opportunities by integrating off-road travel management with on-road management, under the common framework of access management."

The direction under FSM 2355, which sets objectives for recreation, states, "... provide off-road vehicle recreation opportunities that are in concert with the environmental setting, minimize off-road vehicle effects on the land and resources, promote public safety, and control conflicts with other uses of the National Forest System lands."

The regulation 36 CFR 219.21(d), requires that we consider the impacts of proposed recreation activities on other uses and values and the impacts of other uses and activities associated with them on recreation opportunities, activities, and quality of experience. Off-road vehicle use is specifically addressed by 36 CFR 219.21(g):

Off-road vehicle use shall be planned and implemented to protect land and other resources, promote public safety, and minimize conflicts with other uses of the National Forest System lands. Forest planning shall evaluate the potential effects of vehicle use off roads and, on the basis of the requirements of 36 CFR 295 of this chapter, classify areas and trails of National Forest System lands as to whether or not off-road vehicle use may be permitted.

Executive Order No. 11644, as amended by Executive Order 11989, directs that the designation of off-road vehicle areas shall be based upon minimizing damage to soils, watersheds, vegetation, and other resources, and minimizing conflicts with other uses. The travel map development, which consists of describing how users access the Ochoco National Forest and Crooked River National Grassland, is consistent with this direction. It includes all forms of travel, including on-road and off-road.

Traffic management (on-road) and off-road vehicle standard and guidelines for all management areas were determined through an integrated interdisciplinary team approach and are found in the prescriptions in Chapter 4 for the Forest and the Grassland Plans.

Implementation

The following is representative of the action items or activities which will be scheduled and completed through implementation of the Forest and Grassland Plans:

Enforcement

Orders will be issued by the Forest Supervisor in accordance with 36 CFR 261.50. A copy of the order imposing prohibitions will be placed in the offices of the Forest Supervisor and district rangers.

The closures and restrictions (controls) covered under Title 36 CFR 261, Subpart B are applicable and are supplemental to those in 36 CFR 261, Subpart A.

Traffic and Off-Road Management

Uniform travel management direction will be developed for road design standards, road maintenance plans, traffic control devices (to include signing), closure orders, and trail design standards.

Revise the Forest and the Grassland sign plans to
bring them in line with the Plans.

From the appropriate management area direction and standard and guidelines, apply appropriate entrance information that communicates to the Forest and Grassland visitor the current conditions and purpose intended by management.

Establish priorities by management areas to insure consistent and timely application of the travel access management decisions.

Establish travel management needs during each phase of the program development and budget (PD&B) process, identifying those needs and direction specific to the situation.

Explore the potential for using the Forest and Grassland development road system to provide off-road travel opportunities. Roads temporarily closed to vehicular traffic could be used to supplement off-road vehicle opportunities.

**Education and Involvement**

Endorse organization of various motorcycle clubs and off-road enthusiasts to help implement this plan. This coalition could help develop, monitor, and maintain existing and new trail systems, which could minimize Forest Service cost through the use of volunteer work and partnership projects.

Initiate a program to educate employees in the technical linkage between the Plans, transportation planning, resource objectives, and travel management.

Implement the monitoring program to keep management appraised of changing needs so that methods, techniques, facilities, and settings can be managed appropriately.

**Revisions**

The Forest and Grassland will move towards controlling off-road vehicle use in order to minimize impacts to resources and other user groups while not necessarily restricting off-road users. The use of closed road systems, and the designation of trails and destinations, will be encouraged for those management areas without existing off-road restrictions, such as General Forest and General Forage.

Additional off-road vehicle recreation opportunity proposals will be in accordance with management area direction and standards and guidelines. All projects and activities are subject to analysis under the National Environmental Policy Act (NEPA) process before they can be implemented.

The travel map will be updated annually or as necessary to reflect these changes as well other changing conditions or new information, such as changes to the traffic management of open on-road use under the Green Dot program. If these or other situations are identified as being outside the limits of acceptable variability, appropriate amendments or other changes may be made. The amendment process, as well as monitoring and evaluation, can be found in Chapter 5 of the Forest and Grassland Plans.

The successful implementation of new off-road vehicle trails, or other changes, will be dependent upon a policy that insures that these opportunities are met through an integrated, interdisciplinary, and public approach, and that they adhere to the requirements of the Forest and Grassland Plans.
Appendix E

Spill Incident Response Plan

The Forest Spill Incident Plan establishes reporting and response procedures to be followed in the event of an accidental spill of toxic, hazardous or otherwise dangerous materials, including petroleum products.

Because of the serious health and water pollution potential of many of the materials used with our varied land management activities and transported across our land, spills will be given the same emergency priority as a forest fire.

The Plan relies on the expertise of the local, state and federal agencies, and private contractors for spill containment and cleanup. The Forest Service’s role in a spill incident is communication and coordination. The key Forest players in a spill response are Dispatch and the Forest spill coordinator. They may request others to assist them, depending on the nature of the spill.

Spill Response

Health and Safety

Of paramount importance is the health and safety of personnel at the spill site, and of downstream water users if supplies are contaminated.

When approaching any spill site, the following precautions must be taken.

- Approach from the up wind direction if possible;
- Keep all unauthorized people away from the spill site;
- Avoid inhaling fumes, smoke, vapors and dust even if no hazardous materials are involved; and
- Do not assume that gases or vapors are harmless because of lack of smell.

Identify the spilled material from a distance as soon as possible. Until the material is identified, avoid all contact including breathing fumes.

Remember that the Spill Plan is written for professionals trained and equipped for emergency responses. The people at the spill site are probably not such professionals, and should not be encouraged to exceed their abilities.

Priority should be given to notifying downstream water users, especially those with domestic, fish hatchery, and irrigation supplies.

Responsibility

The party responsible for the spill should be identified as soon as possible. This party is responsible for containment and cleanup of the spill and is liable for any damages that might occur. The party is also responsible for reporting spill incidents involving toxic, hazardous or otherwise dangerous materials to the appropriate state and federal agencies. The Forest Service will also notify local, state and federal agencies of such spills to ensure that the proper agencies are promptly notified.

Spill Containment

Upon evaluating a spill incident (identification of the material, health and safety problems, and quantity), action will be taken as soon as possible to contain the material at the immediate spill site. This
Grassland Plan
Appendix E

is especially important if there is a potential for contaminating nearby streams, lakes, or wetlands and downstream water supplies.

Exceptions to taking any immediate containment action would be when the spill material is extremely hazardous and is beyond the ability of the agency and local contractors to handle or it cannot be adequately identified.

Spill Cleanup

All spills involving toxic or hazardous materials or other substances which could contaminate nearby streams, lakes, wetlands or downstream water supplies will be cleaned up as soon as possible.

Spills involving toxic or hazardous materials should be evaluated for having the cleanup and disposal work performed by companies that specialize in this type of work.

Responsibilities of Forest Personnel

Reporting Person

Avoid contact with spilled material.

Call Dispatch for help.

Identify yourself, tell how you can be contacted, location of spill, identity & quantity of spilled material.

Isolate the spill area.

Wait for additional instructions.

Dispatch

Obtain information from Reporter to fill out Spill Incident Report (See Figure E-1).

Notify Forest Spill Coordinator or the Forest Alternate Spill Coordinator.

If no one can be reached in 1 & 2 above, call OARS and follow their instructions (see Notification List).

Forest Spill Coordinator

Notify and coordinate with the appropriate local, state and federal agencies for spill scene security, containment, and cleanup.

Assure the health and safety of Forest personnel and the Public.

Inform the Forest Supervisor, District Ranger and appropriate Forest staff of spill incident status.

Notify downstream water users of spills if there is a potential for contamination of domestic, or irrigation water supplies.

Prepare initial and final spill response reports for each incident.

Notify the Regional Office of spill.

Provide Forest leadership in Spill Response planning.

Water Quality

Memorandum of Understanding between the U.S. Department of Agriculture, Forest Service and the Oregon Department of Environmental Quality

December 1, 1978

This document can be found at the Ochoco National Forest Supervisor's Office, in Forest Service Manual 1561.5 - Water Department (Irrigation and Flood Control), Exhibit 1.

The Memorandum of Understanding between the Oregon Department of Environmental Quality (DEQ) and the U.S. Department of Agriculture, Forest Service (USFS), delineates the responsibilities and activities to be performed by each agency pursuant to the implementation of the Oregon Statewide Water Quality Management Plan on lands administered by the USFS.

The Statewide Water Quality Management Plan has been developed to meet the requirements of state law, federal law, the Federal Water Pollution Control Act, and the Clean Water Act.

The DEQ's overriding purpose is to control pollution. The Forest Service's job is to manage public national forest lands. Under the memorandum of understanding, USFS and DEQ mutually agree to specified provisions in order to prevent duplication of effort and provide the coordination necessary to meet the implementation requirements of the Clean Water Act.

Specified provisions cover a range of areas, including: agency roles; implementation, coordination, and administration of the memorandum; and designations of control.
Appendix G

Section 1

Chronological History

Crooked River National Grassland

1869  Surveyors begin to plot Townships in Central Oregon (the Grassland locale).
1880 to 1913  Homesteading active.
1929 and 1930  Stockmarket crash and drought.
1931  Congress authorizes Federal Farm Board to investigate possibility of reducing the amount of submarginal land in cultivation.
1931  A national conference on land utilization held.
1932  National Land Use Planning Committee made up of Federal bureaus and land-grant colleges is created.
1932  Bureau of Chemistry and Soils undertakes a nationwide classification of land according to its physical adaptability for various uses. Its report shows 454,000 farms in problem areas on land too poor to provide a living, involving some 75 million acres.
1933  The National Resource Board prepares a comprehensive report on the land and water resources of the United States. The report suggests that national policies should promote land ownership and land use patterns that are clearly in the interest of the general public rather than individuals or groups. The Board recommends that the Federal Government acquire some 75 million acres of land to “supplement the assistance to private forestry and erosion control work.” The Board suggests acquiring selected areas of submarginal land and demonstrating how it could be used to serve the public. The necessity of relocating occupants of the land and providing a greater economic base in the submarginal farmland areas was recognized.
1935  Resettlement Administration is formed in the Department of Agriculture. Repurchase of abandoned farms begins.

Resettlement Administration is transferred to the Resettlement Administration from the Federal Emergency Relief Administration (FERA).

1937  Congress passes the Bankhead-Jones Farm Tenant Act (see Appendix G2). Title III of the Act directs the Secretary of Agriculture “to develop a program of land conservation and land utilization, including the retirement of lands that are submarginal or not primarily suitable for cultivation in order thereby to correct maladjustments in land use.”

Resettlement Administration is moved into the Department of Agriculture and renamed the Farm Security Administration. The Land Utilization Program is transferred to the Bureau of Agricultural Economics.

1938  Land Utilization Program is transferred to the Soil Conservation Service.

1946  Acreage acquired under the Land Utilization Program totals 11,299,000 acres. Total cost was $47.5 million, or an average of about $4.40 per acre for the land purchased.

1954  A total of 8,847,000 acres in Land Utilization Projects are assigned by the Secretary of Agriculture to the Forest Service. This included 6,958,000 acres assigned on this date from the Soil Conservation Service, 1,062,000 acres earlier assigned, and 827,000 acres under Forest Service custodianship that were being managed by State agencies under long-term leases or sales contracts.

Eighteen Land Utilization Projects, containing 2,464,000 acres, were transferred to the Bureau of Land Management. Eighty of the Land Utilization Projects, totaling 1.3 million acres, were transferred to the State and local agencies.

1960  The Secretary of Agriculture designates 19 of the Land Use Projects acquired by the Forest Service as National Grasslands. The name “Central Oregon Land Utilization Project” is officially replaced by Crooked River National Grassland.

1970  Forest Service Manual amended making it Forest Service policy to manage National Grasslands under the principles of multiple use.
Section 2

Bankhead-Jones
Farm Tenant Act

Title III

Sec. 31. “The Secretary is authorized and directed to develop a program of land conservation and land utilization, in order thereby to correct maladjustments in land use, and thus assist in controlling soil erosion, reforestation, preserving natural resources, protecting fish and wildlife, developing and protecting recreational facilities, mitigating floods, preventing impairment of dams and reservoirs, developing energy resources, conserving surface and subsurface moisture, protecting the watersheds of navigable streams, and protecting the public lands, health, safety, and welfare, but not to build industrial parks or establish private industrial or commercial enterprises.” (7 U.S.C. 1010)

Sec. 32. In order to put the above program into practice, the Secretary of Agriculture is authorized to do the following:

Protect, improve, develop, and administer any property acquired, and to construct structures that may be necessary in adapting land to its most beneficial use.

Sell, exchange, lease, or otherwise dispose of any property acquired. Any sale, exchange, or grant shall be made only to public authorities and agencies, and only on the condition that the property is used for public purposes. An exception to this provision may be made, allowing exchanges with private owners or agencies of State governments, if the Secretary decides that it would not conflict with the purposes of the land conservation and utilization program.

Make dedications or grants for any public purpose, and to grant licenses and easements under reasonable terms. However, this does NOT include granting easements for rights-of-way (Federal Land Policy and Management Act of 1976).

Cooperate with Federal, State, territorial, other public agencies, and local nonprofit organizations in developing land conservation and utilization programs involving conservation, development, and utilization of water for the benefit of aquatic animals or plants, or for recreational development. This involves assisting in carrying out such plans by:

Making loans (normally of not more than $500,000),

Conducting surveys and investigations relating to conditions and factors affecting the overall program and methods of accomplishing the aquaculture program,

Bearing the costs of installing any works of improvement applicable to the goals of the overall program,

Providing technical and other assistance, and

Paying for any storage of water included in reservoir structures involved in the aquaculture program, and needed for rural community water supply.

Make rules and regulations as necessary to prevent trespasses, and regulate use and occupancy of these lands. Violations shall be punished by a fine of not more than $500 or imprisonment, or both.

Sec. 33. At the end of each calendar year, the Secretary will pay 25 percent of the net revenues received from the use of the land (not from the sale of land) to the county in which the land is held. If the land is
situated in more than one county, the amount to be paid will be divided equitably among the respective counties.

These payments will be made on the condition that they be used for school or road purposes, or both.

Section 3

Administration of Lands Under Title III of the Bankhead-Jones Farm Tenant Act by the Forest Service

Authority: 50 Stat. 525, as amended, 7 U.S.C. 1010-1012.

213.1 Designation, administration and development of national grasslands.

Land utilization projects administered by the Department of Agriculture are named and referred to as "national grasslands."

They are part of the National Forest system and are permanently held by the Department of Agriculture for administration under the provisions and purposes of Title III of the Bankhead-Jones Farm Tenant Act.

They shall be administered under sound and progressive principles of land conservation and multiple use, and to promote development of grassland agriculture and sustained-yield management of the forage, fish and wildlife, timber, water, and recreational resources in the areas of which the national grasslands are a part.

Resources shall be managed to maintain and improve soil and vegetative cover, and to demonstrate sound and practical principles of land use for the areas in which they are located. The Chief of the Forest Service shall provide policies for management of Federally-owned lands that exert a favorable influence for securing sound land conservation practices on associated private lands.

There are 20 national grasslands in 11 states throughout the midwest, southwest, and west. The Crooked River National Grassland is the only one located in Oregon.

213.2 Authority for Chief, Forest Service, to group, define, and name national grasslands.

The Chief of the Forest Service is authorized to group national grasslands into administrative units; to define, change or modify their boundaries; and to provide specific designations as necessary and desirable for effective and economical administration.

213.3 Protection, occupancy, use, administration, and exercise of reservations.

In general, the rules and regulations applicable to national forests as designated in Title 36, Code of Federal Regulations are used to govern the national grasslands. Provided, however, that Forest Service officers, under delegated authority, may acquire lands, make exchanges, grant leases, and enter into leases, permits, agreements, contracts and memoranda of understanding involving lands as authorized by Title III of the Bankhead-Jones Farm Tenant Act.

213.4 Prior rules and regulations superseded.

The rules and regulations issued before September 18, 1962, for land utilization projects, are superseded. However, existing valid rights, reservations, easements, leases, permits, agreements, contracts, and memoranda of understanding, which affect these lands, shall continue as long as they remain in accordance with their designated terms.

Section 1

Mineral Potential

1 A complete copy of the Mineral Potential Report for the Crooked River National Grassland is available at the Supervisor's Office

Lands Involved

The Crooked River National Grassland lies within Jefferson County, in T10S through T13S, and R11E through R15E, W.M. The Grassland encompasses 173,629 acres; 111,379 acres are under Forest Service administration, and 62,250 acres are either privately owned or owned by other government agencies.

In the eastern part of the Grassland, rolling hills and mountains dominate the landscape. The western part is a plateau dissected by steep-sided canyons. Temperatures are moderate and rainfall averages 10.5 inches per year. The land is used for cattle grazing, recreation and wildlife habitat. It is easily accessed by State Roads 26 and 97, and a well-developed system of Forest Service roads.

Status Record Data

The land administered by the Forest Service in the Grassland consists of 100,379 acres of acquired land and 10,806 acres of public domain land. The mineral rights are vested in a number of different owners:

- Public domain lands where the mineral rights are owned by the United States.
- Acquired lands where mineral rights are owned either privately or by the United States.
- Private lands where mineral rights are owned either privately or by the United States.

Minerals are classified as locatable, leasable or saleable. Locatable minerals are deposits that are subject to disposal under the 1872 Mining Law. This law allows individuals to locate, develop and patent mining claims on public domain lands. Gold, silver, mercury and diatomite are locatable minerals if the deposits occur on public domain lands.

Leasable minerals are exempted from the 1872 Mining Law. Instead, these minerals are disposed of through a leasing system. On public domain lands, energy and fertilizer minerals are leasable. On acquired lands, all minerals (except saleable minerals) are leasable.

Saleable, or common variety, minerals include sand, gravel, cinders and stone. They are disposed of through a permit system under the Materials Act of 1947 as amended. On acquired lands, common variety minerals may only be sold to public agencies and for public purposes.

At present, there are 7,160 acres of land in the southeastern part of the Grassland under lease for oil and gas. A total of 29,408 acres have been leased in the past. One well was drilled in the 1960's but was abandoned when it proved dry. No further drilling has been attempted.

Three hardrock exploration permits have been issued in T13S R13E W.M. No leases have been issued in this area.

There are no mining claims located on the Grassland.
Regional Geology

Three physiographic provinces occur in the Grassland: the southwest part of the Blue Mountains province, the High Lava Plains province and the Deschutes-Umatilla Plateau province.

The oldest rocks in the Grassland belong to the late Eocene Clarno Formation and are about 40 million years old. The Clarno Formation consists of a series of rhyolite, andesite and basalt flows, pyroclastic rocks (tufts and breccias) and some waterlaid sedimentary rocks.

The late Oligocene and early Miocene John Day Formation is approximately 30 million years old. It is made up of rhyolitic flows, bedded tuff and varicolored fluvatile and lacustrine tuffaceous sedimentary rocks.

The Columbia River Basalt Group, a series of thick, dark-gray basalt flows, is middle to late Miocene in age (10 to 15 million years old). These rocks occur in isolated outcrops in the Grassland.

The Pliocene Dalles Formation (approximately 3 million years old) consists of water-laid, pumice-rich pyroclastic rocks interbedded with basalt and andesite flows. The Dalles Formation is capped with younger basalt flows.

Recent basalt flows can be found in the canyons of the Deschutes and Crooked Rivers. The canyons were cut by the rivers, and then filled by the lava flows. The rivers have since partially eroded the flows, resulting in steep-sided, narrow canyons.

Mercury, Gold and Silver

Local Geology and Mineral Deposits

Anomalous values for mercury and gold have been detected in the Gray Butte area in the southeastern part of the Grassland. This area is underlain by the John Day Formation and faulted by northeast-trending faults. Small outcrops of Columbia River Basalt overlie the John Day Formation in the faulted area.

Cinnabar (HgS) is the principal mercury ore mineral. Cinnabar deposits are most often found in regions of Tertiary and Quaternary orogeny and volcanism. The cinnabar is deposited from mineralized hot waters related to magmatic activity, and the deposits usually contain calcite and chalcedony. The hot, mineralized solutions rise along faults, cooling as they near the surface. As they cool, cinnabar is deposited in fractures and voids. The host rocks are often altered in both composition and appearance by the mineralized solutions. The principal products of this alteration are clay, silica and carbonate materials (Brooks, 1971).

Gold also occurs in hydrothermal deposits. The gold is deposited by mineralized solutions traveling through fractured zones. These deposits can also contain quartz, calcite, silver, sulfides, and cinnabar (Brooks, 1968; Jenson, 1981).

The Gray Butte mercury prospect is located in SE1/4 Section 13, T13S, R13E W.M, approximately 1-1/2 miles north of Gray Butte. Brooks (1963) reported cinnabar along an east-trending fault zone approximately 1,000 feet long. He also reported a 2- to 6-foot wide rib of silicified tuff bordered on the north by a 2-foot wide zone of silicified gouge and brecciated tuffs, with cinnabar occurring as fracture coatings along the north side of the rib.
During a field visit to the Gray Butte Prospect, the Ochoco National Forest Geologist examined the fault zone but did not find any cinnabar.

Two miles southwest of Gray Butte, in SE1/4 SE1/4 Section 22, T13S, R13E, W.M, a hydrothermally-derived calcite vein, a pebble dike and a garnet-bearing breccia outcrop in the John Day Formation (Gray, 1986).

**Mineral Exploration and Development**

The Gray Butte Prospect was discovered by Staley in June 1942 (Brooks, 1942). Rodman and Chamness located the Tom and Jerry claims here in 1955. A trench about 25 feet wide has been dug along the fault zone for a distance of approximately 400 feet, and numerous small exploration pits have been dug in the area.

In 1963, H.G. Plog, a Forest Service geologist, conducted a mineral examination of the claim group and declared the claims invalid due to lack of discovery. The claims are abandoned.

Jerry Gray and Gary Baxter of the Oregon Department of Geology and Mineral Industries sampled the pebble dike outcrop for assaying and petrographic analysis. Six samples were assayed. All six samples showed detectable amounts of gold. Two samples contained anomalous silver values, and one sample contained anomalous mercury values (Gray, 1986).

The Bureau of Land Management sponsored the geochemical analysis of 74 stream sediment samples, 55 rock chip samples and 22 drill core samples in the Gray Butte area. The samples were collected in:

- T12S R13E Sections 29, 31, 32 and 36;
- T13S R13E Sections 5, 8, 9, 10, 12, 13, 14, 22, 23, 24, 25, 26, 27, and 36;
- T13S R14E Sections 8, 9, 10, 19, 20, 21, 22, 27, 28, 29, 31, 32, and 33.

The analysis of these samples showed some anomalous gold and mercury values (Rimal, 1987).

**Mineral Production and Marketing**

Mercury is used for industrial, chemical and military purposes. The world sources of mercury are concentrated in a few areas, and imbalances in supply and demand are common. Because of rapid price fluctuations, the U.S. mercury industry is highly unstable. Oregon's mercury mines have operated almost exclusively during periods of war (Brooks, 1971).

According to Brooks, the Gray Butte prospect has produced less than 1 flask (76 pounds) of mercury (Brooks, 1971).

**Mineral Potential**

Based upon existing information, the geologist of the Ochoco National Forest classified the Gray Butte area as having moderate potential for mercury, gold and silver, with a Level of Certainty C (BLM Manual 3031, see Appendix A). Refer to the Mineral Potential map in the map packet for the location of this area.

Moderate potential is defined as: "The geologic environment, the inferred geologic processes and the reported mineral occurrences or valid geochemical/geophysical anomaly indicate moderate potential for accumulation of mineral resources" (BLM Manual 3031).

Level of Certainty C is defined as: "The available data provide direct evidence but are quantitatively minimal to support or refute the possible existence of mineral resources" (BLM Manual 3031).

Existing information indicates that this area warrants further exploration work to discern its true mineral potential.
Diatomite

Local Geology and Mineral Deposits

An active diatomite mine on the Deschutes River is located 1/2 mile south of the Grassland's southern boundary, approximately 6 miles west of Terrebonne. Diatomite is a lightweight sedimentary rock composed of the siliceous shells of microscopic aquatic plants called diatoms. Diatomite has a wide variety of industrial uses, including use as a filter aid, a filler in paints, paper and plastics, and as an insulating material.

The diatomite occurs in a roughly circular deposit in the late Tertiary Deschutes Formation. Sand and volcanic detritus underlie the deposit, and sand and gravel deposited by the Deschutes River cover the diatomite. The deposits formed in the bed of a lake dammed by lava flows. Because the deposit is very clean, it is likely that the lake was fed by springs instead of streams (Bates, 1969).

Mineral Exploration

Geologic conditions favorable for similar diatomite deposits occur in the Grassland, especially along the Deschutes and Crooked Rivers. Winters (1983), in his mineral investigation for the Deschutes River Rare II area, did not discover any diatomite deposits. In addition, neither Williams (1957), Walker (1977), nor Peck (1983) indicate any diatomite deposits on their map. However, a diatomite deposit could easily be overlooked if it were covered with overburden, as is the case with the Terrebonne deposit.

Mineral Potential

Based upon existing information, the geologist of the Ochoco National Forest classified the Crooked River/Deschutes River area as having a moderate potential for diatomite, with a Level of Certainty A (BLM Manual 3031, see Appendix A). Refer to the Mineral Potential Map in the map packet for the location of this area.

Moderate potential is defined as: “The geologic environment, the inferred geologic processes and the reported mineral occurrences or valid geochemical/geophysical anomaly indicate moderate potential for accumulation of mineral resources” (BLM Manual 3031).

Level of Certainty A is defined as: “The available data are insufficient and/or cannot be considered as direct of indirect existence of mineral resources within the respective area” (BLM Manual 3031).

It is possible that further exploration could result in the discovery of a diatomite deposit in the area indicated on the map.

Oil and Gas

The oil and gas potential of the Grassland is not well-defined. Although areas of the Grassland have been leased for oil and gas development, only one hole has been drilled. This hole was abandoned after proving dry.

Central Oregon is believed to be underlain by Mesozoic marine sediments that could produce petroleum. However, the thick covering of volcanic rocks has deterred exploration (Newton, 1965).

Smith (1976) classified the eastern portion of the Grassland as prospectively valuable for oil and gas (see the Oil and Gas Potential Map, Figure 1-3, p. 1-9). This classification is based on the assumption of 1,000 feet of sedimentary rocks occurring within 10,000 feet of depth.

The oil and gas potential of the western part of the Grassland is low to zero. Here, the presence of volcanic activity in the Cascades may have metamorphosed any organic matter to a thermal state which would destroy hydrocarbons (Fouch, 1983).
Geothermal Energy

There are no Known Geothermal Resource Areas (KGRA) or Potential Geothermal Resource Areas (PGRA) listed within the Grassland by USGS (Justus, 1979).

The Oregon Department of Geology and Mineral Industries has classified the entire Grassland as favorable for the discovery of geothermal resources. This classification is based on various geothermal, volcanic and tectonic phenomena including thermal wells, youthful volcanism, mineralization, and anomalous concentrations of faults and lineaments (Oregon Department of Geology and Mineral Resources, 1982).

Two thermal wells are located near the Grassland boundary southeast of Madras. One, located in NE1/4 NE1/4 Section 24, T11S R13E W.M, intercepts water measuring 25 C (77 F). The other, with water at 21 C (70 F) is located in SE1/4 NE1/4 Section 24, T11S R13E W.M. (Oregon Department of Geology and Mineral Industries, 1982).

Rockhounding Areas

Rockhounding is a popular activity on the Ochoco National Forest, and minerals of interest to rockhounds occur in several locations on the Crooked River National Grassland.

Shirley (1965 and 1967) located the following deposits on the Grassland.

- Agate: T13S R13E Section 26
- Amethyst and agate: T13S R13E Sections 17,18,19,20
- Jasper and agate: T13S R13E Section 28
- Moss agate: T11S R14E Section 15
- Moss agate: T10S R14E Sections 10,11
- Angel wing agate: T10S R15E Section 12, T10S R15E Section 6
- Petrified wood: T13S R14E Section 30.

Common Variety Minerals

There are 13 developed materials sources on the Grassland. Refer to Table 11-1 for material types and land status of these sources.

Only three of these sources, Round Butte, Schmoker and Cyrus, have development plans.

Round Butte has an estimated reserve of 400,000 cubic yards (cy) of cinders, an estimated demand of 10,000 to 20,000 cy per year, and therefore, a lifespan of 20 to 40 years. Oregon State Highway Department removes approximately 70,000 cy each decade. The Forest Service, Jefferson County, and the City of Culver also use cinders from this source. The cinders are used for aggregate for road construction and to improve traction on icy roads.

Schmoker has an estimated reserve of 40,000 cy of basalt of variable quality. This quarry is used primarily by Jefferson County for road construction.

Cyrus contains fine-grained, weathered basalt which is easily rippable. No reserve estimates are available.

McPheeters contains an estimated 84,000 cy of basalt. This quarry is used primarily by the Oregon Department of Transportation.

There appears to be a sufficient supply of rock to meet the local demand in the next decade. The development of a rock resource management plan that addresses long-term supply and demand, as well as area management strategies, would assure a continuing supply of these materials.

Oil and Gas Lease Stipulations

Stipulations will be included in leases to protect surface resources. A stipulation may be modified or waived if the Forest Service determines that factors have changed so that the protection provided by the stipulation is no longer justified, or that the proposed operation would not cause unacceptable impacts.

The following stipulations will be included in all leases:

- Allow no occupancy or other surface disturbance on slopes in excess of 30 percent.
- Allow no occupancy or surface disturbance in the vicinity of eagle, hawk, or owl nesting sites as specified in Wildlife and Fish Standards and Guidelines.
- To maintain esthetic values, require all semipermanent and permanent facilities to be painted or camouflaged to blend with the natural surroundings.

Additional stipulations will be required in the following Management Areas.

Antelope Winter Range
Allow exploration, drilling, and other developmental activities only between April 1 and November 15 to reduce harassment to antelope on the winter range. This limitation does not apply to maintenance and operation of producing wells.

Cove Palisades State Park
Allow no occupancy or other surface disturbance within park boundary.

Haystack Reservoir
Allow no occupancy or other surface disturbance.

Juniper Old Growth
Allow no occupancy or other surface disturbance.

Metolius Deer Winter Range
Allow exploration, drilling, and other developmental activities only between April 1 and November 15 to reduce harassment to deer on the winter range. This limitation does not apply to maintenance and operation of producing wells.

Research Natural Areas
Allow no occupancy or other surface disturbance.

Rimrock Springs Wildlife Area
Allow no occupancy or other surface disturbance.

Riparian Areas
Allow no occupancy or other surface disturbance within riparian zones.

Squaw Creek
Allow no occupancy or other surface disturbance within Squaw Creek canyon.

Utility Corridors
Allow no drilling or storage facilities within 2,000 feet of utility lines.
Section 3

Land and Mineral Estates on the Crooked River National Grassland

There are eight administrative land categories involved within the Crooked River National Grassland. The laws and regulations governing the administration and disposal of minerals vary according to land categories.

For administrative purposes, Federal minerals are divided into the three categories that follow.

1. **Locatable minerals:**
   Uncommon varieties of sand, stone, gravel, cinders, pumice, pumicite or cinders;
   All “valuable mineral deposits” (General Mining Law, 1872) except those specifically excluded as leasable or salable.

2. **Leasable minerals:**
   All minerals except salable minerals on acquired lands;
   Coal, phosphate, oil, gas, chlorides, sulfates, carbonates, borates, silicates or nitrates of potassium or sodium, native asphalt, solid and semisolid bitumen and bituminous rock including oil-impregnated rock or sand from which oil is recoverable only by special treatment after the deposit is mined;
   Geothermal resources and associated by-products.

3. **Salable minerals:**
   Common varieties of sand, stone, gravel, cinders, pumice, pumicite and clay.

The eight administrative land categories involved within the Crooked River National Grassland are:

1. **Land acquired under Title III of the Bankhead-Jones Farm Tenant Act that are administered by the Crooked River National Grassland.** Mineral ownership is vested in the United States.

   Under this category, minerals that would normally be locatable are instead classified as leasable. Thus, all minerals, except salable minerals, are disposed of through a leasing system. Salable minerals may be disposed of only to public authorities and agencies, and only on the condition that the minerals are used for public purposes (FRF 228.41(4)).

2. **Lands reserved from the public domain that are included as part of the Crooked River National Grassland.** Mineral ownership is vested in the United States.

   Under this category, locatable minerals are available for location under the 1872 Mining Law, unless the land is specifically withdrawn from the operation of the mining laws. In other words, any citizen of the United States, or person declaring his/her intent to become a citizen, may locate a mining claim for the purpose of developing a mine. Leasable minerals are disposed of through a leasing system. Salable minerals may be disposed of by sale, free use permit or contract (CFR 228.57).

3. **Lands acquired under Title III of the Bankhead-Jones Farm Tenant Act and administered by the CRNG, but all or part of the mineral rights are in private ownership.**

   The mineral rights vested in the United States will be administered as in (1) above. The development of the minerals rights in private ownership is, of course, controlled by the owner. However, because the United
States owns the surface rights, surface use would be administered by the United States in cooperation with the owner of the mineral estate.

(4) Lands acquired under Title III of the Bankhead-Jones Farm Tenant Act and administered by the CRNG, but all or part of the mineral rights are vested in the State of Oregon.

This situation is the same as (3) above, except that the State of Oregon replaces the private owner.

(5) Lands reserved from the public domain that are administered by the Deschutes Area of BLM's Prineville District. Mineral ownership is vested in the United States.

BLM administers minerals on these lands.

(6) Private lands with all or part of the mineral ownership vested in the United States.

Minerals are administered as in (2) above. State law protects and regulates the surface owner's rights.

(7) Private ownership with partial mineral ownership vested in the United States.

Minerals owned by the United States are administered as in (6) above. When the land and minerals are both privately owned, they are privately administered.

(8) Lands and minerals are privately owned.

These land and mineral estates are privately administered.
Section 4

Materials Source Management Plan

This appendix contains information from the Crooked River National Grassland Materials Source Management Plan. The entire Plan can be found in the Forest Supervisor's Office in Prineville, Oregon.

Summary and Conclusions

Thirteen materials sources were identified on the Grassland. Mineral rights at each materials source are owned by the United States. The property lines and extent of federal mineral ownership at McPheeters M.S. are pending the outcome of a survey that will be completed by April 1989.

Two of the materials sources have up-to-date development plans. Three have development plans in progress pending completion of airphoto-derived topographic maps in 1989 or 1990. Four materials sources are in occasional use and need development plans completed or updated. Three materials sources will receive no foreseeable use and need rehabilitation plans. One material source should be rehabilitated for recreational use by off-road vehicles.

A total of approximately 9,000-15,000 cubic yards of material are removed from the Grassland each year, and an additional 30,000 cubic yards are removed for special projects about every 5 years.

At the present rate of use, rock supplies are adequate for the next 20 years. It is unclear whether or not there will be adequate supplies further into the future due to the difficulty of projecting a future rate of use.

Recommendations

Long-term use permits issued in the 1950's and early 1960's should be discussed with the five agencies currently in their possession and, if possible, terminated or replaced with short-term use permits.

Canal M.S. should be closed to use as a borrow and waste storage site and rehabilitated for use by off-road vehicles.

Waste storage at Boyce M.S. should be discontinued. Use of this materials source should be limited to removal of the two existing stockpiles, and the area should then be rehabilitated and closed to future use.

Grandview M.S., which is located inside Cove Palisades State Park, should be rehabilitated and closed to future use.

Haystack M.S. and Big Canyon M.S. have no anticipated use, and should be rehabilitated and closed to future use.

Unauthorized removal of material occasionally occurs at sites outside of recognized materials sources. Rehabilitation should be accomplished at these unauthorized sites to discourage future removal of material.

The feasibility of a land exchange agreement should be examined as a means of giving the Forest Service's portion of Round Butte M.S. and McPheeters M.S. to the state.
A new pit run or grid roll material source on the west side of the Deschutes River would be valuable for Forest Service road maintenance in that area. Examination of the area for a new material source should be concentrated in the area where the Clarno Formation is exposed.

On some of the material sources, long-term use permits have been issued. Long-term use permits have no expiration date and no stated rate or quantity of removal. One of the requirements listed on the permit is that development plans must be submitted by the permittee and approved in advance by the Forest Supervisor. The long-term permits on the Grassland predate the National Forest Management Act of 1976, which sets a 10-year limit on permits issued to government agencies (36 CFR 228.62(b)). As a result, these long-term permits are grandfathered in.

Recommendation is hereby made that the long-term permits be discussed with the five agencies involved and be terminated or replaced, if possible, with short-term use permits. Conversion to short-term use permits would allow more up-to-date use records and improved management of the materials sources by the Forest Service.

Short-term use permits, generally for a period of less than one year, are called mineral material use permits (form FS-2800-9). They may be obtained from the Crooked River National Grassland District Office.

Development and Rehabilitation

Provisions must be made in contracts and permits to ensure the efficient removal and conservation of the material (36 CFR 228.47(c)). Requirements for reclamation of the areas disturbed by removal must also be included (36 CFR 228.47(f)). The Forest Service must prepare the development and reclamation plans if the material is in a community site or common-use area (36 CFR 228.64).

For removal of more than 5,000 cubic yards of material or disturbance of more than one acre during a 12-month period, non-Forest Service entities must obtain development and land reclamation permits from the Oregon Department of Geology and Mineral Industries and must have a long- or short-term use permit from the Crooked River National Grassland. For removal of less than 5,000 cubic yards, non-Forest Service entities are required to have a long- or short-term use permit from the Grassland. The Grassland District notifies the Engineering Section of the Ochoco National Forest Supervisor's Office so that use records in the individual materials source files can be kept up-to-date. The Forest Service may use its own materials sources without need for a permit, but is responsible for having a development plan and accomplishing final rehabilitation.

Development plans take into account the need for visual screening, drainage, road access, crusher and stockpile locations, variation in material quality, and the method of excavation of the material. The Forest Service follows the regulations of the Federal Mine Safety and Health Administration in regard to height and slope of working slopes and benches.

Two of the materials sources on the Grassland have up-to-date development and reclamation plans: Round Butte M.S. and Cyrus M.S. Three materials sources will have airphoto-derived topographic maps: McPheters M.S. will have its topographic map completed by April 1989, while Metolius M.S. and Japanese Creek M.S. will be completed in spring 1990. When each detailed topographic map for these three quarries is made available, a development and reclamation plan should be completed. The following five materials sources are in occasional use, and need to be surveyed with a compass and clinometer and have development and reclamation plans completed or updated: Geneva M.S., Boyce M.S., Fence M.S., and Schmoker M.S. There are three materials sources that will receive no foreseeable use and are in need of reclamation plans: Grandview M.S., Haystack M.S., and Big Canyon M.S. One material source, Canal M.S., should be rehabilitated for recreational use and is in need of a reclamation plan.

Rehabilitation plans take into account the need for proper sloping of pit or quarry walls, spreading stockpiled overburden over excavated areas, mulching, and reseeding. The Ochoco National Forest follows regulations of the Oregon Department of Geology and Mineral Industries Mined Land Reclamation Program in regard to specification of final slopes and other reclamation practices.

Specifications of Rock Quality and Quantity

Gravel Roads

Forest Service gravel roads in the Grassland are maintained as low-traffic-volume roads, in which base material is used but not surfacing material. Road maintenance includes blading, primarily to provide adequate drainage on the roads, and secondarily to improve driveability. Water bars may be bladed into the roads. Most of the Forest Service roads in the Grassland that are gravel roads are intended for vehicles with high clearance.

Table 1-2 summarizes the Forest Service and Oregon State Highway Division (OSHD) requirements for crushed aggregate to be used on gravel roads. Lower-grade material such as pit run or borrow material is not expected to meet these specifications because they are used on low-traffic-volume roads.
Rock from Schmoker M.S. was crushed for use in surface rock and base rock on county roads, and was expected to meet the specifications.

The state has no gravel roads in the Grassland under its jurisdiction, but Jefferson County has jurisdiction over several gravel roads in the Grassland and follows state requirements for rock quality. The Forest Service has jurisdiction over many gravel roads in the Grassland and follows Forest Service requirements for rock quality.

**Paved Roads**

There are no paved roads in the Grassland under the jurisdiction of the Forest Service, except for two short lengths of pavement—one on the south side of Haystack Reservoir and one on the east side of the reservoir leading into a campground. The Federal Highway Administration will be adding to the pavement on the south side of the reservoir in 1991 or 1992, and this addition will be under the jurisdiction of the Forest Service. The state maintains two paved roads—Highway 97 and Highway 26. Jefferson County has jurisdiction over all other paved roads in the Grassland, and is in the process of paving many of their gravel roads using rock obtained from a privately-owned rock quarry north of Grizzly Mountain. The Oregon Parks and Recreation Division has jurisdiction over roads within Cove Palisades State Park.

Table I-3 summarizes the Forest Service and Oregon State Highway Division requirements for paved roads. Jefferson County follows the state requirements for rock quality, and the Federal Highway Administration follows their own third set of requirements. The table gives the requirements for "flexible pavement" rather than for roads with a "chip seal" surface.

---

**Determination of Excavated Volume from In-Place Volume**

The quality of the material is taken into consideration in determining excavated rock volume from in-place volume. Material used from gravel roads ideally contains a percentage of silt and clay sufficient to act as a binder. This rock will generally swell approximately 20% upon excavation. Cinders are porous and readily break down, generally decreasing in volume by 70% leaving 30% of original in-place volume. Material used in paving, "oil rock," ideally contains no silt or clay. If any silt or clay is present a "scalper," which is a screen, may be used to remove them, or they may be removed by washing. For oil rock, excavated volume should equal in-place volume.

</table>

The first test listed in Table I-2 is the percent wear or abrasion test. Test 96 of the American Association of State Highway and Transportation Officials (AASHTO) is also known as the Los Angeles Rattler (LAR) test. This test indicates the relative resistance of material to breakdown into sand-sized or smaller particles as a result of tumbling in a cylinder with a prescribed number of 2-inch metal spheres. A high number indicates that the material readily wears into sand-sized or smaller particles.

The second test in Table I-2 is the durability index or fine aggregate degradation test. It indicates the relative resistance of material to break down into claylike small particles as a result of agitation in a container with water, calcium chloride, glycerine, and formaldehyde. The USFS test has a minimum requirement because the post-test weight of the material that doesn't pass through a sieve is reported as a percentage of the pre-test weight of the total sample. The state test has a maximum requirement because they report the percentage of the material that does pass through the sieve.

The liquid limit is that water content of at which the material passes from a plastic to a liquid state.

The plasticity index is the range of water content within which the material is in a plastic state.

The sand equivalent test is intended to show the percentage of sand-sized particles in a sample. The sample is agitated in a cylinder containing water, calcium chloride, glycerine, and formaldehyde. After agitation, the material in the cylinder is allowed to settle for 20 minutes and then the amount of material that has accumulated at the bottom of the cylinder is measured.
Description of Individual Materials Sources

The individual materials sources on the Grassland have been classified according to the Unified Rock Classification developed by Doug Williamson of the Forest Service. This classification scheme provides a brief description of the engineering characteristics of rocks based on observations in the field. When used with other geotechnical information such as water table location, it permits an estimate of rock performance in such areas as excavation, slope stability, material use, blasting character, and water transmittal. It is not used to classify unconsolidated sand and gravel deposits. The Unified Rock Classification is listed in Table I-4.

Table I-5 lists the individual materials sources and summarizes information on the rock type, Unified Rock Classification (URC), primary use of the materials source, and secondary use.

The following paragraphs describe the individual materials sources in order by their primary use.

Pit Run

Pit run material consists of native materials that are of a size and grading that can be taken directly from the source and placed on the road without crushing.

There are three materials sources on the Grassland that contain pit run material. Two of them, Geneva M.S. and Round Butte M.S., are composed of cinder, while Cyrus is composed of fractured basalt of the Clarno Formation.

Cyrus M.S.

Cyrus Material Source is located on the northeastern slope of Gray Butte, approximately one mile north of the top of Gray Butte. It was discovered about 15 years ago by the Forest Service road crew. Visibility of the pit from Highway 26 became a problem as the pit enlarged, and was mitigated by construction of berms on the northwest and northeast sides of the excavation area. The berms have been seeded so they will blend in with the hillside and shield view of the excavation from Highway 26. Any southwestward expansion of the pit further into the hillside beyond the limits of the current 1988 pit plan will require close cooperation between the Engineering Section and the Grassland District to ensure that visual constraints are met; excavation further into the hillside may require higher berms.

The 1988 pit plan shows that the current excavation may be extended 100 feet to the northwest and not at all in the other directions. Drill hole data indicate that the highly fractured basalt at the surface extends downward 12 to 17 feet. Less-weathered, and therefore less-broken rock, is encountered below 12 to 17 feet. This material would probably be gridrollable in contrast to the pit-run material at the surface, and may even require crushing. The rock extends to more than 108 feet, which is the depth of the deepest of four drill holes at the site.

Based on the current development plan, which shows excavation to about 15 feet in depth, there are about 150,000 cubic yards of material remaining. The material contains a sufficient amount of silt and clay to set up almost like concrete when used on gravel roads, and this, in combination with its average size of 2 inches in diameter, makes it ideal pit run material for use on the low volume gravel roads on the Grassland. This rock has been used by the Forest Service at Haystack Reservoir's boat ramp and parking lot and on many of the gravel roads in the area. If used by other agencies it would be rapidly depleted, so it is reserved for exclusive long-term use by the Forest Service. Access to the materials source is restricted by a locked gate near the entrance to the pit.

For a brief description of each test, see Table 1-2

Note that in sampling material for rock quality testing, a representative sample must be obtained from the area to be mined. Sampling technique is important so that the test results reflect the rock quality that will be obtained from the quarry and not just the best rock in the quarry.

Table 1-4
Unified Rock Classification System by Doug Williamson

In using the Unified Rock Classification System, one observation that best describes the rock is chosen from each of four sets of descriptive terms, and the corresponding letter symbols are assigned to the rock.

### Planar and Linear Terms

- **B**: Pits with hammer blow--free-draining, high energy transfer in response to blasting
- **C**: Dents with hammer blow--usually not suitable for road fill or surfacing and is not free-draining, low energy transfer in response to blasting
- **D**: Craters with hammer blow--responds to freeze-thaw stresses by cracking, produces poorly drained embankments, not suitable for road fill or surfacing, very low energy transfer when blasting
- **E**: Moldable with finger pressure--must be evaluated as a soil for design purposes

### Unit Weight Terms

- **A**: Greater than 160 pounds per cubic foot--suitable more than 50% of the time for use as road aggregate, concrete aggregate, or riprap without laboratory testing
- **B**: From 150 to 160 pounds per cubic foot--requires laboratory testing
- **C**: From 140 to 150 pounds per cubic foot--typically not suitable for use as road aggregate, concrete aggregate, or riprap, does not produce free-draining fill, and will probably degrade
- **D**: From 130 to 140 pounds per cubic foot--typically not suitable for use as road aggregate, concrete aggregate, or riprap, does not produce free-draining fill, and will probably degrade
- **E**: Less than 130 pounds per cubic foot--likely to degrade during excavation under abrasion of excavating equipment

### Round Butte M.S.

Round Butte material Source is a cinder pit complex located on the north slope of Round Butte, approximately two miles east of Round Butte Dam and the Deschutes River. Round Butte is included in the pit run category because this material would be used by the Forest Service as pit run material although the Forest Service has not used any cinder from this pit to date. The primary user of this pit crushes the cinder for use in sanding icy paved roads.

The state is the primary user of the pit, although the City of Culver has a long-term use permit and has removed small quantities of cinder. The state owns the mineral rights in the SW 1/4 Section 13, which is in the western half of the cinder pit complex, and has a long-term use permit from the Forest Service in the rest of the material source. Even though the state has a long-term use permit, it nevertheless obtains short-term use permits, this serves as a way of keeping the Forest Service informed of its rate of use.

Cinder was removed from the middle level of the pit complex many years ago, probably during the 1940's and 1950's. Hazardous vertical walls and narrow haul roads at the middle level are the legacy from this era of excavation. The state is now removing material from the top of the pit complex downward and will gradually obliterate the hazardous area, leaving an overall 2:1 slope. The cinder pit is not visible from the paved road and viewpoint at the top of Round Butte, which is part of Cove Palisades State Park.

Every 4 or 5 years the state crushes approximately 20,000 cubic yards of material to store in a stockpile and use over several years. As a result, the state obtains a reclamation permit from the Oregon Department of Geology and Mineral Industries about every 5 years and the pit is listed as inactive during the other years. In 1987 the state crushed 25,000 cubic yards of which 4,500 cubic yards were obtained
from Forest Service property. This cinder was removed under a 1987 permit from the Forest Service for removal of 70,000 cubic yards of material over 10 years. At the current rate of use, this 1987 permit will allow two more entries before the permit needs to be renewed.

Because a more durable material is available in this area for road construction, this cinder is best suited for its present use in road sanding. The state had seven rock quality tests run in 1963, on cinders sampled from various locations in the pit complex. The tests revealed an LAR of 45-50, liquid limit of 34-41, and no plasticity. No drilling has been done to determine the extent of the cinder deposit, but based on the current rate of use and a brief visual inspection of surface material, there is sufficient material for the next 20 years.

Because the state is the primary user of this material source and owns the mineral rights in the western part of the pit complex, it is recommended that the Forest Service look into the feasibility of giving their portion of Round Butte M.S. to the state as part of a land exchange agreement.

Geneva M.S.
Geneva M.S. is located about 3 miles west of Juniper Butte, overlooking the Crooked River Gorge. Long-term use permits by Deschutes Valley Water District and Jefferson County indicate development and use of this cinder pit by those agencies. The Forest Service has not obtained material from this pit.

Cinder from the pit has been excavated using a backhoe, screened, and used on roads in the immediate vicinity. There is currently a screen and a stockpile of 8-inch-minus material near the center of the pit. Oversized cinder and basalt boulders from the 5-foot-thick overlying basalt flow are stored on the western side of the pit near the cliff edge. The pit is now about 200 feet by 200 feet in size. The cinder extends down about 30 feet below the present depth of excavation based on exposures in the canyon wall. This indicates that there are about 30,000 cubic yards of cinder remaining. Thirty percent of 30,000 cubic yards of in-place volume calculates to about 9,000 cubic yards of excavated volume remaining.

The pit may be expanded to the north, east, and south, but it is unknown how far the cinder extends horizontally beneath the capping basalt flow. No drilling has been done to determine the extent of the cinder deposit. This pit is well-suited for its current low-volume, local use.

Grid Roll
Grid-roll material consists of native materials of a quality that can be taken directly from the source, without crushing, and broken down on the road by a grid roller. This material generally is platy or partially decomposed rock that is too large in size to be pit run material.

There are two materials sources that primarily contain grid roll material. Both are in the John Day Formation.

Fence M.S.
This material source is located along Road 53, approximately 7 miles southeast of Madras. The material is platy welded ash, and a portion of the materials source has already been removed. Approximately 600 cubic yards of material is available for future excavation, and may be removed up to a fenceline without adverse visual impact. The area for future excavation is approximately 20 feet wide, 150 feet long, and 5 feet deep.

Haystack M.S.
Haystack Materials Source is located on a butte approximately one mile south of Haystack Reservoir. This material has been used on county roads in the area. Long-term use permits are held by Jefferson County and the City of Culver.
The pit is currently at its limits of expansion due to visual constraints. It is unknown how much deeper the excavation may be extended, but probably not more than 20 feet based on a brief visual inspection. No drilling has been done in the pit. The material abruptly becomes clayey on the western side of the pit, and this white, clayey material should be avoided. Based on an excavation 50 feet wide, 400 feet long, and 20 feet deep, there are approximately 15,000 cubic yards of material remaining. Approximately 500 cubic yards of riprap have been stored near the center and on the western side of the excavation. This riprap may not be durable as indicated by the ready decomposition of the smaller-sized rock from this pit where it has been used on the road into the campground at Haystack Reservoir.

This materials source has received little use in the past 10 years. Access is restricted by a locked gate at the beginning of the access road.

Because the rock decomposes readily and there is no anticipated demand for the rock, it is recommended that this materials source be rehabilitated and closed to future use.

**Crusher**

Material for crushing must meet the requirements listed in Table 1-3 on specifications of rock quality for paved roads. In general descriptive terms, material suitable for crushing is clean (lacking in silt and clay), hard, and durable. Two of the materials sources in this category are in the Columbia River Basalt Group, and one is in the Clarno Formation.

**Schmoker M.S.**

Schmoker Materials Source is located on a butte approximately 4 miles east of Madras. This quarry was developed by the state during paving of Highway 97, and it contains clean, durable rock suitable for use in paved roads. In 1986, Jefferson County crushed 20,000 cubic yards of rock, stockpiled 25% of it for Forest Service use, and removed the balance for use as base rock and leveling rock on two gravel county roads in the area. The Forest Service has already used half of the stockpiled crushed rock leaving 2,500 cubic yards for future use.

The 1986 development plan is now in need of updating due to removal of material from Phase 1 and Phase 2 by Jefferson County in 1986. No drilling has been done in this quarry to aid in determination of the extent of the resources. Based on a brief visual inspection, the floor of the quarry could be lowered to remove approximately 15,000 cubic yards and bring it to the depth shown on the 1986 development plan. An additional 15,000 cubic yards may be removed to let down the quarry floor to the depth of the underlying ash bed. The floor may be lowered on the west side of the quarry only, because the westward-dipping ash bed, which is unusable, already has been encountered on the east side. West side lowering of the quarry floor must not disturb the outslope, which provides a visual barrier.

The Forest Service uses approximately 2,000 to 3,000 cubic yards per year for road maintenance. At this rate, the materials source will be exhausted in about 10 years. Because there is a limited amount of rock left in this pit, future use should be reserved for the Forest Service exclusively.

**McPheeters M.S.**

McPheeters Materials Source is located approximately 1.5 miles east of Highway 97 and 3 miles northwest of Smith Rock State Park. It contains clean, durable rock suitable for use in paved roads although the north side of the pit contains clayey material. Due to questions concerning landownership in the area, property lines will be posted on the ground by April 1989, by a surveyor under contract to the Forest Service.

The Oregon State Highway Division developed the quarry originally, and over the course of many years removed approximately 50,000 cubic yards of rock. Jefferson County removed 30,000 cubic yards in 1986 for use as base rock and as leveling rock on about 15 gravel county roads.

A 1985 development plan is in need of updating using new land ownership determinations and detailed topographic data that will be available by April 1989. Rock from Phases 1, 2, and 3 of the 1985 plan were removed by Jefferson County in 1986, leaving approximately 70,000 cubic yards available.
for future use in Phases 6 through 8. No drilling has been done in this quarry to delineate the extent of the resource. The quarry is at its limit of expansion on the north side due to visual constraints and due to the presence of a clay block that extends to an unknown depth and over which the basalt lava apparently flowed and abruptly decreased in thickness. Development of the quarry may continue indefinitely back into the hillside to the east and may extend to neighboring knobs to the south depending on the outcome of the property ownership determination.

Two rock quality tests were run in 1987 by the state, one of which was from 1-inch-minus rock that Jefferson County had crushed. The crushed rock had test results as follows: abrasion of 16, fine aggregate degradation of 30, and sand equivalent of 35; fines with a liquid limit of 45 and plasticity index of 16 were present in the sample. This sample does not meet requirements for oil rock, but may be used on gravel roads. A second rock sample from the quarry had test results as follows: abrasion of 17, fine aggregate degradation of 17, and sand equivalent of 41; no fine-grained sand, silt, or clay were present. This sample meets specifications for oil rock.

The Federal Highway Administration would like to obtain 20,000-30,000 cubic yards for construction work on the road south of Haystack Reservoir in about 2 or 3 years. The state would like to remove about 40,000 cubic yards for overlay work on the Madras Highway in about 4 or 5 years. The Forest Service uses approximately 300-400 cubic yards per year for road maintenance.

The state is the primary user of this pit and apparently owns the mineral rights in the area where the materials source will be developed in the future. Because of this and because this pit is outside the Grassland boundary, it is recommended that the Forest Service examine the possibility of giving their portion of McPheeters M.S. to the state as part of a land exchange agreement.

Japanese Creek M.S.
Japanese Creek Materials Source is located approximately 1.5 miles south of Highway 26 and 4 miles southwest of Grizzly Mountain. It was developed by the state, and the material consists of clean, durable rock suitable for crushing. The Forest Service has used this rock for gabions at the Haystack Reservoir boat ramp and uses 800-1,000 cubic yards per year for road maintenance.

No drilling has been done in this quarry, but the rock may extend to approximately 50 feet in depth based on the visually estimated thickness of this geologic unit exposed in outcrops one mile to the north as viewed looking south from Gray Butte. Opalized flow breccia from the top of the basaltic lava flow is present on the north side of the quarry. The rock unit dips 5 degrees to the southeast. Assuming that the quarry may be extended to the south approximately 1,000 feet, in an east-west direction 200 feet, and to a depth of 50 feet, the total resources of the quarry are roughly estimated as 370,000 cubic yards. Due to the remoteness and seclusion of the location, there are no visual constraints to development. The southern boundary of the Grassland occurs less than 1/2 mile south of the quarry.

Riprap
Riprap is large, durable pieces of rock that are placed to prevent erosion and thereby preserve the underlying surface or structure. There is only one material source on the Grassland with its primary use as supply of riprap, although several other materials sources may supply riprap as a secondary function.

Boyce M.S.
Boyce Material Source is located approximately 2 miles west of Highway 26 and about 3 miles northeast of Haystack Reservoir. The quarry is a roadcut along the east side of Road 89, and was probably developed by the state.

Rock that may be removed without adverse visual impact consists of 5-feet-minus boulders that are in two stockpiles of about 500 cubic yards each at the
north and south end of the quarry. Removal of these stockpiles would visually improve this quarry, but removal of additional rock would have an adverse visual impact. Fill piles have been placed near the center of the quarry, and these need to be leveled and seeded. Additional waste storage should be discouraged at this site due to its adverse visual impact.

This quarry receives occasional use as a source of riprap. It is not needed for crushed rock due to visual constraints and the availability of rock from Japanese Creek M.S.

**Borrow**
Borrow is earth material such as sand and gravel that is removed to be used for fill at another location. All four of the materials sources in this category are in the Deschutes Formation.

**Metolius M.S.**
Metolius Materials Source is located on a ridge approximately three miles south of Madras, less than 1/4 mile east of Highway 26. This material consists of silty sand and gravel in horizontal beds. It has been used continually by Jefferson County at a rate of 4000 to 5,000 cubic yards per year as base rock on gravel county roads. A privately-owned gravel pit occurs to the north of this materials source.

The material is currently being removed by advancing an upper bench and two lower benches. Advancement of the upper bench removes the top of the ridge, and approximately 75 feet of the original ridgetop remains in the northern end of the pit. The two lower benches are at the same horizontal level but are advancing in opposite directions. No drilling has been done in this pit to determine material type with depth. Assuming that no unusable material is encountered, 500,000 cubic yards of this material may be remaining. At the present rate of removal, the resource will last for well over 50 years. Development of the pit should take into account visual constraints, which will become important as excavation proceeds and the ridge becomes lower.

**Grandview M.S.**
Grandview Materials Source overlooks Lake Billy Chinook on the west side of the Deschutes River canyon, about 5 miles southwest of Round Butte Dam. Silty sand, gravel, and cobbles occur in this material source. Cobble material is generally too numerous and too large for use on gravel roads. Use of this materials source, in the past, by the Forest Service road crew, required waste storage of large amounts of the excavated material.

Because this materials source is located inside Cove Palisades State Park and there is no anticipated demand for the rock, it is recommended that this materials source be rehabilitated and closed to future use.

**Canal M.S.**
Canal Material Source is located two miles east of Highway 97 and 1 mile north of McPeeters M.S. This site was developed as an artillery target range during World War II and has since been used as a borrow source and for waste storage. In one outcrop the material consists of approximately 30% silty sand and 70% gravel that is generally 1 to 3 inches in diameter. The site is currently within an off-road vehicle (ORV) management area and is being used by motorcycles and all-terrain vehicles. Because this material is not in demand and is low in quality, it is hereby recommended that this materials source be closed and rehabilitated for use by recreational vehicles.

**Big Canyon M.S.**
Big Canyon Material Source is located south of the Metolius River, approximately 4 miles southwest of Round Butte Dam. This materials source is not in current use and was not visited for review in this report. Leroy Burke, of the Forest Service road crew, reports that the rock consists of clayey gravel and is not suitable for use on the gravel roads in the area.

Because there is no anticipated demand for the rock, this materials source should be rehabilitated and closed to future use.
Projections of Future Use

Materials supplies are adequate for the next 10 years, but it is unclear whether or not there will be adequate supplies further into the future. Visual constraints, noise constraints, and other limits on development of materials sources will make development of new sites more difficult as population in the area increases. In addition, increasing numbers of houses in the Madras-Redmond-Prineville area will occupy areas that could otherwise be good sources of material, bringing added pressure on Forest Service land to supply rock to the county and state.

Projections of the amount of material that will be needed by the State, Jefferson County, Federal Highway Administration, and Forest Service were obtained by contacting each agency. The use of the materials determines the type of material needed, and supplies of materials are needed as close to the area of use as possible to reduce haul distances and thereby reduce costs. As a result, the use for the material is noted and the amount of material is attributed to specific materials sources that contain rock of appropriate quality and that are located close to the area of use.

Oregon State Highway Division

In a telephone conversation with Rolland Van Cleve on 10-7-88, future needs of the Oregon State Highway Division were estimated as:

Round Butte M.S.--approximately 4,000 to 5,000 cubic yards per year for road sanding on state highways in the Madras area.

McPheeters M.S.--approximately 40,000 cubic yards will be needed in about 1991, for an overlay on the Highway 97 high bridge over the Crooked River (T. 13 S., R. 13 E., Sec. 32).

Japanese Creek M.S.--If rock is not available from McPheeters due to ownership problems, the rock may be obtained from Japanese Creek M.S.

The State does not anticipate expanding Highway 97, between Redmond and Madras, to a 4-lane highway in the foreseeable future.

Jefferson County

In a telephone conversation with Don Wood on 10-7-88, future needs of Jefferson County were estimated as:

Metolius M.S.--approximately 2,000 to 4,000 cubic yards per year for road maintenance in the Madras area.

The County has approximately 700 miles of road, of which about 200 miles are paved. The County is paving some of their gravel roads each year, and expect this paving program to continue for about 20 years. Most of the material needed for their paving is obtained in a private quarry about 2 miles northwest of the townsite of Grizzly, from which they extract approximately 50,000 to 60,000 cubic yards per year. The County expects this quarry to be able to continue to supply large quantities of rock for the next 20 years.

Federal Highway Administration

In the same telephone conversation with Don Wood on 10-7-88, future needs of the Federal Highway Administration were estimated as:

McPheeters M.S.--approximately 20,000 to 30,000 cubic yards to move the road on the south side of Haystack Reservoir from its current route through a farmer's yard to a nearby route on land donated by the farmer. The road work would be done in about 1991 or 1992, by the Federal Highway Administration in cooperation with Jefferson County and Ochoco National Forest.

The Federal Highway Administration paves public access roads into national forest land using money directly from Congress. The Federal Highway
Administration can pave only state or county roads, not Forest Service Roads—Forest Service roads are paved by private contractors using Forest Service money budgeted to the Federal Road Program. The Oregon State Highway Division, representing itself and the counties, meets with the Forest Service and the Federal Highway Administration yearly to decide which state and county roads the Federal Highway Administration should pave for Forest land access.

**Forest Service**

In a conversation with Jim Zimmerlee of the Ochoco National Forest Engineering Office on 10-14-88, the issue of Forest Service jurisdiction versus Jefferson County jurisdiction on roads leading into the Grassland was discussed. Some county roads provide access to Grassland land only and the Forest Service would like to obtain jurisdiction over them and maintain them at the level at which they receive use. Some roads currently maintained by the Forest Service primarily serve residents of the area, and the Forest Service would like to give its jurisdiction of these roads to the County. Overall, there are more roads for which the Forest Service wants to give jurisdiction to the County than the Forest Service wants to obtain from the County. If the jurisdiction exchange occurs, the County would have additional roads that would eventually be paved by them using rock mostly from the private quarry north of Grizzly Butte.

In a conversation with Leroy Burk on 10-7-88, future needs of the Forest Service on the Grassland were estimated as:

**Cyrus M.S.**—approximately 3,000 to 4,000 cubic yards per year for road maintenance and small projects.

**Schmoker M.S.**—approximately 2,000 to 3,000 cubic yards per year for road maintenance.

**McPheeters M.S.**—approximately 300 to 400 cubic yards per year for road maintenance in the immediate vicinity.

**Japanese Creek M.S.**—approximately 1,000 cubic yards per year for road maintenance and for the new boat ramp and parking area at Haystack Reservoir.

**Boyce M.S.**—approximately 400 pieces of 2-feet to 4-feet diameter riprap for use at Haystack campground.

A new pit run or grid roll rock source on the west side of the Deschutes River would be valuable for Forest Service road maintenance in that area. Approximately 2,000 cubic yards would be used per year on Road 6350 and Road 6360 if a suitable rock source could be found. Grandview M.S. and Big Canyon M.S. are in the area but are not suitable for pit run or grid roll use. Examination of the area for a potential material source should concentrate on the area where the Clarno Formation is exposed.

Table I-6 summarizes the availability and demand for rock from each materials source. The estimated amount of rock available from each materials source is based only on brief visual inspection except at Cyrus M.S., where drilling has been done. As a result, these estimated amounts are subject to revision, pending drilling.

A total of approximately 9,000 to 15,000 cubic yards of material are removed from the Grassland yearly for maintenance of gravel roads and sanding icy paved roads. An additional 30,000 cubic yards are removed approximately every 5 years for paving projects by the Oregon State Highway Division, Jefferson County, and the Federal Highway Administration. Material is obtained mostly by three agencies from four materials sources: the Oregon State Highway Division (4,000-5,000 cubic yards per year from Round Butte M.S., of which approximately 1,000 cubic yards per year is from the Forest Service portion of Round Butte M.S.), Jefferson County (4,000-5,000 cubic yards per year from Metolius M.S.), and the Forest Service (7,000-9,000 cubic yards per year dominantly from Cyrus M.S. and Schmoker M.S.).

At the present rate of use, rock supplies are adequate for the next 20 years. It is important to note that this assumes that the estimated resource figures are accurate. After 20 years, Round Butte M.S., Schmoker M.S., and Boyce M.S. will be exhausted. It is unclear whether or not there will be adequate supplies further into the future due to the difficulty of projecting a future rate of use.

* Approximately 1,000 cubic yards per year of this 4,000 to 5,000 per year total is obtained from the Forest Service portion of Round Butte M S, the majority of the rock is from the state-owned portion of the materials source. The estimated resource amount includes both the state-owned and Forest Service-owned portions.

** Not currently in demand.

1/ Recommended for closure.

2/ Initial entry and development is in the Forest Service-owned portion of the materials source. Continued development will enter onto the state-owned portion, most of the resource is state-owned.

3/ If not obtained from McPheeters.

Rimrock Springs Wildlife Management Area

Management Plan and Memorandum of Understanding

The Rimrock Springs Wildlife Management Area is located in the center of the Crooked River National Grassland, adjacent to State Highway 26, midway between Prineville and Madras.

The presence of ponds and springs in a semiarid grassland ecosystem provides a wide variety of plant communities and unique wildlife habitat in a relatively small area. The presence of rimrock, old homesteads with farm fields, and a variety of plant communities on various soil types adds to the diversity.

In the past, activities have focused on administrative grazing and hunting uses. More recently, demand for environmental study, wildlife viewing, photography, and nature study by numerous individuals and groups has increased.

Because of these demands, the 450-acre area has been developed cooperatively with the state and private groups. Two official documents dealing with the area, both signed in 1981, are on file and can be viewed at the Ochoco National Forest Supervisor’s Office.

Rimrock Springs Wildlife Management Area Management Plan - this document was developed by the Forest Service. While the Grassland Plan provides a description of the area, emphasis and desired future condition (Chapter 4, Section 2), as well as management practices, standards and guidelines, this management plan contains more detailed descriptions of habitat and wildlife, and actions to be taken in order to meet objectives for the area.

Memorandum of Understanding between the USDA Forest Service and the Oregon Department of Fish and Wildlife for Administration of Rimrock Springs Area - this document was drawn up in cooperation with the two mentioned parties, and outlines the administration of the area, the responsibilities and coordination of agencies involved, and contains the legal description of the area.
Appendix K

Cooperative Agreement
With the State of Oregon
for Cove Palisades State Park

Background
Cove Palisades State Park is a developed recreation complex - campgrounds, boat ramps, swimming beaches, and picnic grounds - located on the Deschutes and Crooked River arms of Billy Chinook within the boundaries of the Crooked River National Grassland.

Land ownership within the park is a mix of State and Federal lands totalling 7,000 acres, as follows:

State Land 1,434 acres
Leased from Forest Service (National Grassland) 2,695
Leased from BLM 1,170
Lake Billy Chinook 1,700

Except for the proposed Island Research Natural Area and fire protection, the park is managed by the State Division of Parks and Recreation with little input or interference from the Forest Service.

The park was originally located along the Crooked and Deschutes Rivers, but was relocated to higher ground along the shores of Lake Billy Chinook and expanded when the Round Butte Dam was constructed.

A file (2740) located at the Ochoco National Forest Supervisor’s Office includes the cooperative agreement between the State of Oregon and Department of Agriculture, signed April 9, 1940, and extensive correspondence between the State and Forest Service regarding the park. Over the years, three main issues have surfaced.

Park Boundary
The files indicate that modification of the park boundary has been discussed by the Forest Service and State, but never fully resolved. In their 1981 master plan, the State proposed changing the park boundary to eliminate 1,080 acres of National Grassland land, located on the outer edges of the park on the plateaus above the canyon rim, that were not considered essential to the managing of the park.

Transfer of Ownership
The files indicate that the idea of transferring most of the National Grassland lands within the park boundary to the State has also been discussed repeatedly. The concept has been supported by both parties, but a transfer has not yet taken place.

The most recent attempt at a land transfer was tabled when the Forest Service/BLM interchange was proposed several years ago. Apparently, the feeling was that the Federal agencies should resolve the land ownership problems between themselves before attempting to deal with the State.

One parcel within the park boundary that the Forest Service has expressed its intent to retain is the Island Research Natural Area, located on a peninsula between the Crooked and Deschutes River arms of Lake Billy Chinook. Most of the Island is under BLM administration, and both agencies agree to manage it as a research natural area.

If Forest Service lands within the park boundary were transferred to the State, the lease agreement would no longer be needed.

1 from The Cove Palisades State Park Master Plan, State of Oregon Department of Transportation, 1981
Minerals

Proposed policies for managing minerals on National Grassland lands within the park boundary have generated the greatest amount of discussion between the State and the Forest Service.

In 1982, the Forest Service prepared an environmental assessment responding to seven applications for oil and gas leases on National Grassland lands within the park. The Forest Service's preferred alternative proposed leasing 900 acres with standard stipulations, 1,000 acres with special stipulations, and 800 acres with no surface occupancy.

In responding to the proposal, the state park administrator stated:

"We strongly recommend that the...Park...not be leased for mineral exploration or only non-surface leasing be considered..."

The National Park Service expressed the opinion that because the park had been developed in part with funds from the Land and Water Conservation Fund, use other than for outdoor recreation could only be permitted if permission was granted from the Secretary of Interior.

The debate never came to a head because the environmental assessment was never signed, and the leases were not developed. However, it is likely there will be interest in leasing again at some time in the future, which suggests that the underlying issues need to be resolved.
Appendix L

Haystack Reservoir
Appendix L

Haystack Reservoir
Recreation Management Plan

Haystack Lake, a 233-acre reservoir, was constructed in 1958. It was constructed to provide interim storage of irrigation water for the Madras-Culver area. North Unit Irrigation District oversees the flow of water and manages the dam and related facilities. The dam was constructed by the Bureau of Reclamation. Reservoir capacity is 5,635 acre feet and is usually held at 80 percent capacity. Water comes to the reservoir from Wickiup Reservoir, via the Deschutes River from Wickiup to Bend, and by canal from Bend.

The reservoir is administered by several federal, state, and county agencies. These include the U.S. Forest Service - Crooked River National Grassland, the Bureau of Reclamation, Oregon Department of Fish and Wildlife, Oregon State Marine Board, North Unit Irrigation District, and Jefferson County. Since each agency has different management objectives, a plan was necessary in order to guide the overall management of the area in a manner agreed upon by all. Consequently, the Haystack Reservoir Recreation Management Plan was developed in 1986.

The plan elaborates on a number of factors involving the reservoir, including:

The Physical Setting - vegetation, wildlife, fisheries and unique habitats; topography and climate; man-made facilities and other recreation sites.

The Social Setting - types of recreational experiences available and the amount and type of contact between people.

The Managerial Setting - management policies and objectives of the agencies involved; public comments and concerns which were well documented through on-site interviews, public meetings and the involvement of local representatives serving on the Haystack Area Planning Committee.

Summary of Past Land Management - land transfer proposals, management agreements, leases, and permits.

Future Management - special zones, area specific developments, a development schedule, and monitoring methods.

The Haystack Reservoir Recreation Management Plan is on file in the Ochoco National Forest Supervisor’s Office.

GLOSSARY

These definitions apply to Forest Service land management and planning. Meanings may differ when used in another context. Some definitions were shortened, paraphrased or adapted to fit local conditions. Definitions of other terms used in resource management but not included in this glossary may be found in the following publications:

* Mifflin, Ronald W. and Hiton H Lysons. Glossary of Forest Engineering Terms. USDA Forest Service, Pacific Northwest Forest and Range Experiment Station; 1979

ACCEPTABLE RIPARIAN CONDITION - A shady, brushy riparian condition with frequent amounts of tall overstory conifer trees and shorter hardwoods of alder, willow and aspen; the site has the potential to produce conifers and/or hardwood species. Moderately gentle bank slopes containing moderate to high plant densities, thick root masses, embedded angular boulders and old logs characterize these areas. Frequent channel scouring and deposition will largely be replaced by mossy aquatic growth on assorted sizes of tightly packed rocks.

ACRE EQUIVALENT - Used to adjust actual acres of habitat improvement or improvement structures to reflect overall habitat benefits derived. It reflects the zone of influence of the habitat improvement for the target species. For example, a single water development for upland game birds has an acre equivalent of 160, whereas a single water structure for big game has a value of 640 because it has a larger zone of influence for the more mobile big-game animals.

ACRE FOOT (ACF) - A unit for measuring a volume of water. Quantity of water required to cover 1 acre (43,560 square feet) to a depth of 1 foot.

ACRES OF DEGRADED WATERSHED CONDITION - Represents existing soil/watershed areas which are degraded and contributing to loss in site productivity and/or creating water quality deterioration when hazardous events occur. The Soil/Water Restoration Inventory (1979) for the Ochoco National Forest (located at the Ranger District Offices) delineates these areas.

ACTIVITY - Actions, measures, or treatments that are undertaken that directly or indirectly produce, enhance, or maintain forest and rangeland outputs or achieve administrative or environmental quality objectives. Forest Service activity definitions, codes, and units of measure are contained in the Management Information Handbook (FSM 1309 11.).

ADVISORY COUNCIL ON HISTORIC PRESERVATION (ACHP) - An independent advisory body established by the National Historic Preservation Act of 1966. The mission of the Council is to advise the President and Congress on national historic preservation policies, to encourage private and public interest in historic preservation, and to review and comment on Federal undertakings that might have an effect on properties listed on or eligible for the National Register of Historic Places.
ALL-TERRAIN VEHICLE (ATV) - An abbreviation whose initials stand for All-Terrain Vehicle, which is any motorized off-highway vehicle 50 inches or less in width. ATV's usually have a dry weight of 600 pounds or less, traveling on three or more low pressure tires and having a seat designed to be straddled by the operator.

AIRSHED - A geographical area that, because of topography, meteorology, and climate, shares the same air.

ALLOTMENT - see Range Allotment

ALLOWABLE SALE QUANTITY (ASQ) - (Comparable to programmed allowable harvest used in previous plans). The quantity of timber that may be sold from the area of suitable land covered by the forest plan for a time period specified by the plan. This allowable sale quantity (ASQ) is usually expressed on an annual basis as the "average annual allowable sale quantity." (FSM 1900).

ALL-TERRAIN VEHICLE (ATV) - Any motorized, off-highway vehicle 50 inches or less in width, having a dry weight of 600 pounds or less that travels on three or more low pressure tires with a seat designed to be straddled by the operator. Low-pressure tires are 6 inches or more in width and designed for use on wheel rim diameters of 12 inches or less, utilizing an operating pressure of 10 pounds per square inch (psi) or less as recommended by the vehicle manufacturer.

ALTERNATIVE - One of several policies, plans, or projects proposed for decision making.

AMENITY - An object, feature, quality, or experience that gives pleasure or is pleasing to the mind or senses. Amenity value is typically used in land-use planning to describe those resource properties for which market values (or noncash values) are not or cannot be established, such as hiking or scenic viewing.

ANADROMOUS FISH - Those species of fish that mature in the sea and migrate into streams to spawn. Salmon, steelhead, and searun cutthroat trout are examples.

ANALYSIS AREA - An area of land (not necessarily contiguous) which for FORPLAN analysis purposes has homogeneous timber management costs and vegetative responses to timber management activities.

ANALYSIS OF THE MANAGEMENT SITUATION (AMS) - A step required under the National Forest Management Act in which the Forest determines its ability to supply goods and services to meet society's demand for them.

ANIMAL UNIT (AU) - An animal unit is a 1,000 pound mature cow, or its equivalent based on an average daily forage consumption of 26 pounds dry matter per day.

ANIMAL UNIT MONTH (AUM) - The amount of forage required by an animal unit for one month.

ANNUAL PROGRAMMED HARVEST - That part of the potential timber yield that is scheduled for harvest in a specific year.

APPROPRIATE SUPPRESSION RESPONSE - The kind, amount, and timing of suppression action on a wildfire which most efficiently meets fire management direction under current and expected burning conditions. The action may be from prompt control to confinement. (See definitions for confine, contain, and control.)

AQUEOUS - Of, relating to, or resembling water

ARCHAEOLOGY - The scientific study of the physical characteristics of cultural resources in order to describe and explain former ways of life

ARTERIAL ROAD - Roads comprising the basic access network for National Forest System administrative and management activities. These roads serve all resource elements to a substantial extent, and maintenance is not normally determined by the activities of any one element. They provide service to large land areas and usually connect with public highways or other Forest arterial roads to form an integrated network of primary...
travel routes. The location and standards are often determined by a demand for maximum mobility and travel efficiency rather than by a specific resource management service. Usually they are developed and operated for long-term land and resource management purposes and constant service.

**B**

*Bacillus thuringiensis* (B.t.) - A biological agent used to initiate insecticidal treatments of the western spruce budworm populations.

**BACKGROUND** - The visible terrain beyond the foreground and middleground where individual trees are not visible, but are blended into the total fabric of the stand. (See "Foreground" and "Middleground.")

**BASALT** - A dark gray to black, fine-grained igneous rock.

**BENCHMARK** - An analysis of the supply potential of a particular resource, or of a set of resources subject to specific management objectives or constraints.

**BENEFIT COST RATIO** - An economic indicator of efficiency, computed by dividing total priced benefits by priced costs. Usually both benefits and costs are discounted so that the ratio reflects efficiency in terms of the present value of future benefits and costs.

**BEST MANAGEMENT PRACTICES (BMP)** - A specific activity, measure, course of action, or treatment.

**BIG GAME (BG)** - Those species of large mammals normally managed for sport hunting, generally elk, deer, and antelope.

**BIOLOGICAL DIVERSITY** - The distribution and abundance of different plant and animal communities and species within the area covered by a land and resource management plan.

**BIOLOGICAL POTENTIAL** - The maximum possible output of a given resource limited only by its inherent physical and biological characteristics.

**BOARD FOOT** - A unit of timber measurement equaling the amount of wood contained in an unfinished board 1 inch thick, 12 inches long, and 12 inches wide.

*Board foot volume measurement varies with size of trees and is designed for certain product specifications and current technology. Young stands that have been regenerated cannot be measured in board foot or equivalent units of measurement, attempting to do so would underestimate the biological potential of timber producing lands and make future growth estimates impossible. See cubic foot.

**BRECCIA** - A rock made up of highly angular coarse fragments.

**BROADCAST BURN** - Allowing a prescribed fire to burn over a designated area within well-defined boundaries for reduction of fuel hazard or as silvicultural treatment, or both.

**C**

**CANOPY CLOSURE** - The progressive reduction of space between crowns as they spread laterally, increasing the canopy density.

**CAPABILITY** - The potential of an area of land to produce resources, supply goods and services, and allow resource uses under an assumed set of management practices and at a given level of management intensity. Capability depends upon current conditions and site conditions such as climate, slope, landform, soils, and geology, as well as on the application of management practices, such as silviculture or protection from fire, insects, and disease.
CAPITAL INVESTMENT COST - Costs generally associated with construction such as trails, roads, and physical structures for range, recreation, and fish and wildlife. Other major functions include reforestation, timber stand improvement and prescribed burning.

CAVITY - The hollow excavated in trees by birds or other natural phenomena, used for roosting and reproduction by many birds and mammals.

CINNABAR - A mineral (HgS) which is the principal ore of mercury

CLEARCUTTING - The harvesting in one cut of all trees on an area for the purpose of creating a new, even-aged stand. The area harvested may be a patch, strip, or stand large enough to be mapped or recorded as a separate class in planning for sustained yield.

COLLECTOR ROAD - Roads that serve smaller land areas than a Forest arterial road, and usually connected to a Forest arterial or public highway. Collect traffic from Forest local roads and/or terminal facilities. The location and standard are influenced by both long-term multiresource service needs, as well as travel efficiency. May be operated for either constant or intermittent service, depending on land use and resource management objectives for the area served by the facility.

COMMERCIAL FOREST LAND (CFL) - Forest land that is producing or is capable of producing crops of industrial wood and (a) has not been withdrawn by Congress, the Secretary, or the Chief; (b) existing technology and knowledge is available to ensure timber production without irreversible damage to soils productivity, or watershed conditions; and (c) existing technology and knowledge, as reflected in current research and experience, provides reasonable assurance that adequate restocking can be attained within 5 years after final harvesting.

COMMERCIAL THINNING - A cut in a stand under rotation age designed to remove excess merchantable trees. The objective is to place the growth capability of the site on the remaining leave trees.

COMmodity - A transportable resource product with commercial value, all resource products that are articles of commerce.

COMMON VARIETY MINERAL - Saleable minerals.

COMMUNITY COHESION - The degree of unity and cooperation evident in a community as it defines problems and attempts to resolve them.

COMMUNITY STABILITY - A community's capacity to handle change without major hardships or disruptions to component groups or institutions. Measurement of community stability requires identification of the type and rate of proposed change and an assessment of the community's capacity to accommodate that level of change.

COMPACT, SOIL - The packing together of soil particles by forces exerted at the soil surface, resulting in increased soil density.

CONCERN - A point, matter, or question raised by management that must be addressed in the planning process.

CONFINE - To limit fire spread within a predetermined area principally by use of natural or preconstructed barriers or environmental conditions. Suppression action may be minimal and limited to surveillance under appropriate conditions.

CONSTANT SERVICE - A road developed and operated for continuous or annual recurrent service.

CONTAIN - To surround a fire, and any spot fires therefrom, with control line as needed, which can reasonably be expected to check the fire's spread under prevailing and predicted conditions.
CONTROL - To complete the control line around a fire, any spot fires therfrom, and any interior islands to be saved, burn out any unburned area adjacent to the fire side of the control line, and cool down all hot spots that are immediate threats to the control line, until the line can reasonably be expected to hold under foreseeable conditions.

CONVERSION PERIOD - A transition period during which an unregulated forest structure is converted to a regulated one. When regulated, the forest will have a distribution of stand age and size classes, providing approximately equal periodic harvests.

CORD - A unit of volume measurement containing 128 cubic feet of solid wood. Generally a stack of round or split wood measuring 4 feet wide by 4 feet high by 8 feet long.

CORRIDOR - A linear strip of land identified for the present or future location of transportation or utility rights-of-way within its boundaries.

COST EFFICIENCY - The usefulness of specified inputs (costs) to produce specified outputs (benefits). In measuring cost efficiency, some outputs, including environmental, economic, or social impacts, are not assigned monetary values, but are achieved at specified levels in the least cost manner. Cost efficiency is usually measured using present net value, although use of benefit-cost ratios and rates-of-return may be appropriate.

COVER/FORAGE RATIO - The ratio, in percent, of the amount of area in cover condition to that area in non-cover or forage condition; the criteria by which potential deer and elk use of an area is judged.

COVER - Vegetation used by wildlife for protection from predators, to ameliorate conditions of weather, or in which to reproduce.

CUBIC FOOT - In timber management a volume measured as a 1 foot cube of solid wood.

*C:Growth and inventory of forest stands is measured in units of cubic foot volume because it is independent of numerous product requirements occurring within a locale, region, or the nation as a whole.

CULMINATION OF MEAN ANNUAL INCREMENT (CMAI) - The age at which a stand of trees no longer increases in average annual growth.

CULTURAL RESOURCES - The remains of sites, structures, or objects used by humans in the past—historical or archaeological.

CULTURAL RESOURCES - Physical remains of districts, sites, structures, buildings, networks, or objects used by humans in the past. They may be historic, prehistoric, archaeological, or architectural in nature. Cultural resources are land based and are nonrenewable.

CUMULATIVE EFFECTS - The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

CURRENT DIRECTION - The direction contained within the following plans that has guided the recent management of the Forest and Grassland.
1. Ochoco-Crooked River Planning Unit Land Management Plan, 1979
DATA - Any recorded measurements, facts, evidence, or observations reduced to written, graphical, tabular, or computer forms.

DATA RECOVERY - Collection of information through any of a variety of techniques (e.g., photography, mapping, archaeological excavation) conducted for purposes of No Adverse Effect or mitigating Adverse Effect. Data collection is designed to recover representative data from a cultural resource prior to its disturbance or destruction.

DBH - Diameter at breast height. Diameter of a tree 4 feet 6 inches above the ground.

DECISION CRITERIA - Essentially the rules or standards used to evaluate alternatives. They are measurements or indicators that are designed to assist a decisionmaker in identifying a preferred choice from an array of possible alternatives.

DECISION VARIABLE - A component of an alternative in which input costs, outputs and benefits are identified and used for analysis and decision making.

DEMAND - The amount of goods or services that will be consumed if offered over a given range of prices at a particular point in time.

DEMOGRAPHIC - Pertaining to the study of the characteristics of human populations, such as size, growth, density, distribution, and vital statistics.

DEPARTURE (DEP) - Timber harvest schedule which deviates from the principle of nondeclining even flow by exhibiting a planned decrease in the timber sale and harvest schedule in the future. A departure is characterized as a temporary increase over the base sale schedule without impairing the Forest's long-term sustained-yield.

DETERMINATION OF ELIGIBILITY - Formal determination by the Keeper of the National Register, Department of Interior, as to whether or not a cultural resource is eligible for listing on the National Register of Historic Places.

DETERMINATION OF EFFECT - Determination of the effect (No Effect, No Adverse Effect, Adverse Effect) a proposed undertaking will have on cultural resources listed on or eligible for the National Register of Historic Places. Requires consultation with the State Historic Preservation Officer and may require review by or consultation with the Advisory Council on Historic Preservation.

DEVELOPED RECREATION - Recreation that requires facilities that, in turn, result in concentrated use of an area. Examples of recreation areas are campgrounds and ski areas; facilities in these areas might include roads, parking lots, picnic tables, toilets, drinking water, ski lifts, and buildings.

DISCOUNT RATE - The interest rate used in plan formulation and evaluation for discounting future benefits and computing costs, or otherwise converting benefits to a common time basis.

DISPERSED RECREATION - A general term referring to recreation use outside a developed recreation site; this includes activities such as scenic driving, hunting, backpacking, and recreation in primitive environments.

DISPERSION - To disperse the effects of timber harvest by distributing harvest units more or less uniformly throughout a drainage so that increased runoff and sediment from disturbed sites will be buffered by lower levels of runoff and sediment production from surrounding undisturbed lands.
DISTRICT - See Ranger District.

DIVERSITY - The distribution and abundance of different plant and animal communities and species within the area.

DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) - The version of the statement of environmental effects required for major Federal actions under Section 102 of the National Environmental Policy Act (NEPA) and released to the public and other agencies for review and comment. It is a formal document which must follow the requirements of NEPA, the Council on Environmental Quality (CEQ) Guidelines, and directives of the agency responsible for the project proposal.

EARNED HARVEST EFFECT (EHE) - An increase in the present harvest based on the expectation of increased yields in the future resulting from management practices such as planting genetically-improved stock and thinning.

ECONOMIC EFFICIENCY - See cost efficiency.

ECOSYSTEM - The interacting system of a biological community and its nonliving environment.

EDGE - The place where plant communities meet or where successional stages or vegetative conditions within plant communities come together. It often contains organisms from both communities as well as those restricted to the interface area. The number of species present is often greater than the surrounding communities.

EFFECTS - Environmental consequences as a result of a proposed action. Included are direct effects, which are caused by the action and occur at the same time and place, and indirect effects, which are caused by the action and are later in time or further removed in distance, but which are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems. Effects and impacts as used in the FEIS are synonymous. Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic quality, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effects will be beneficial (40 CFR 1508.8).

ELIGIBLE - Cultural properties that meet the criteria for listing on the National Register of Historic Places.

EMPIRICAL YIELD TABLE - A table reflecting the existing standing timber volumes today and how they would grow in the future, under various timber management regimes.

ENDANGERED SPECIES - Any species of animal or plant that is in danger of extinction throughout all or a significant portion of its range. Plant or animal species identified by the Secretary of the Interior as endangered in accordance with the 1973 Endangered Species Act.

ENDEMIC - A taxonomic category (e.g., genus, species, variety) whose natural occurrence is confined to a certain region and whose distribution is relatively limited.

ENDEMIC ORGANISM - A taxonomic category (e.g., genus, species, variety) whose natural occurrence is confined to a certain region and whose distribution is relatively limited.

ENHANCE - To improve, reinforce, enrich or strengthen the existing condition, value, or beauty of a resource.

ENHANCEMENT - Interpret cultural resources for the public benefit. Cooperate with museums, universities, and other recognized institutions, agencies, and knowledgeable persons in planning and constructing cultural resource exhibits involving National Forest System cultural resources. Coordinate these efforts with
interpretive Services people (FSM 2390). Enhancement efforts may include the full range of interpretive techniques. Because enhancement may affect the resource, comply with regulations set forth in FSM 2366. In all cases consider a determination of beneficial effect (FSM 2366 26).

ENVIRONMENT - The sum of all external conditions and influence affecting the life, development, and survival of an organism.

ENVIRONMENTAL ANALYSIS - An analysis of alternative actions and their predictable short- and long-term environmental effects, incorporating the physical, biological, economic, social, and environmental design arts and their interactions.

ENVIRONMENTAL ASSESSMENT (EA) - A concise public document required by the regulations implementing the National Environmental Policy Act.

EPIDEMIC - An outbreak of sudden rapid spread, growth, or development.

EPITHERMAL MINERAL DEPOSIT - A deposit formed in rocks of shallow depth from low-temperature hydrothermal solutions.

EQUIVALENT CLEARCUT AREA (ECA) - That area which when harvested under any of the various silvicultural regimes produces hydrological effects similar to one acre of clearcut.

EQUIVALENT HARVEST AREA (EHA) - The same as Equivalent Clearcut Area (ECA).

EROSION - The processes whereby earthy or rocky material is worn away, loosened, dissolved and removed from any part of the earth’s surface.

EVAPOTRANSPIRATION - Process by which water moves from the soil to the atmosphere by evaporation from the soil or transpiration through plants.

EVEN-AGED MANAGEMENT - The application of a combination of actions that results in the creation of stands in which trees of essentially the same age grow together. Managed even-aged forests are characterized by a distribution of stands of varying ages (and, therefore, tree sizes) throughout the forest area. The difference in age between trees forming the main canopy level of a stand usually does not exceed 20 percent of the age of the stand at harvest rotation age. Regeneration in a particular stand is obtained during a short period at or near the time that a stand has reached the desired age or size for regeneration and is harvested. Clearcut, shelterwood, or seed tree cutting methods produce even-aged stands.

EXCELLENT RIPARIAN CONDITIONS - An extremely shady and brushy riparian condition with an abundance of tall overstory conifer trees and shorter hardwoods of alder, willow and aspen will be present; the site has the potential to produce conifer and/or hardwood species. Gentle bank slopes, high plant densities, thick root masses, embedded angular boulders and old logs characterize these areas. Channel scouring will be minimized with deposition replaced by mossy aquatic growth on assorted sizes of tightly packed rocks.

FAULT - A fracture or fracture zone along which there has been displacement of the sides relative to one another parallel to the fracture.

FAWNING AREAS - areas used regularly by female deer for fawning (and maintaining fawns for their first few days or weeks); optimum fawning habitat includes low shrubs or small trees under a tree overstory of about 50-percent closure, usually located on slopes of less than 15 percent where vegetation is succulent and plentiful in June and potable water is available within 183 meters (600 feet).

FINAL ENVIRONMENTAL IMPACT STATEMENT (FEIS) - The final version of the statement of environmental effects required for major Federal actions under Section 102 of the National Environmental Policy Act (NEPA). It is a revision of the Draft Environmental Impact Statement to include public and agency responses to the
draft. It is a formal document which must meet legal requirements and is the document used as a basis for judicial decisions concerning compliance with NEPA.

**FIRE HAZARD REDUCTION** - The treatment of fuels and residues, which reduces the potential fire's rate of spread or intensity.

**FIRE MANAGEMENT EFFECTIVENESS INDEX (FMEI)** - A number derived by totaling the cost of a fire protection organization and fire suppression cost with the net value change and dividing that figure by 1000 acres.

**FIREWOOD** - Wood, either round, split or sawn, and burned primarily for heating purposes

**FISCAL YEAR (FY)** - October 1st to September 30th

**FLOODPLAIN** - The lowland and relatively flat areas adjoining inland and coastal waters (including debris cones and floodprone areas of offshore islands) including, at a minimum, those areas subject to a one-percent or greater chance of flooding in any given year (100-year recurrence)

**FORAGE (LIVESTOCK)** - All grass and grass-like plants

**FORAGE (WILDLIFE)** - All browse and herbaceous food that is available to wildlife for grazing.

**FORBS**

1. Any herbaceous plant other than those in the Gramineae (true grasses), Cyperaceae (sedges) and Juncaceae (rushes) families - i.e., any nongrass-like plant having little or no woody material on it.

2. A palatable, broad-leaved, flowering herb whose stem (above ground) does not become woody and persistent.

**FOREGROUND** - A term used in scenic management to describe the stand of trees immediately adjacent to a high-value scenic area, recreation facility, or forest highway (See "Background" or "Middleground.")

**FOREST AND RANGELAND RENEWABLE RESOURCES PLANNING ACT OF 1974 (RPA)** - An Act requiring the preparation of a program for the management of the National Forests' renewable resources and of Land and Resource Management Plans for units of the National Forest System. It also requires a continuing inventory of all forest, rangelands, and renewable resources nation-wide

**FOREST DEVELOPMENT ROADS (FDR)** - Roads that are part of the Forest transportation system, which includes all existing and planned roads, as well as other special and terminal facilities designed as Forest development transportation facilities.

**FOREST HEALTH** - A condition where biotic and abiotic influences on the Forest (i.e. insects, diseases, atmospheric deposition, silvicultural treatments, harvesting practices) do not threaten management objectives either now or in the future

**FOREST INVENTORY PLAN** - A plan, based on known cultural and environmental information, that delineates areas of varying degrees of suspected cultural resource potential.

**FOREST PLAN** - The National Forest Land and Resource Management Plan (Forest Plan) guides all natural resource management activities and establishes management standards and guidelines for the Forest. It describes resource management practices, levels of resource production and management, and the availability and suitability of lands for resource management. It is prepared under the implementing regulations and requirements of NFMA

**FORESTRY PROGRAM FOR OREGON (FPFO)** - A comprehensive forest management program developed by the State of Oregon for all forest lands in the state regardless of ownership.
FOREST STANDARD - A performance criterion indicating acceptable norms or specifications that actions must meet to maintain the minimum conditions for a particular resource. This type of standard applies to all areas of the Forest regardless of the other management area direction applied.

FOREST SUPERVISOR - The official responsible for administering the National Forest System lands in a Forest Service administrative unit. He or she reports to the Regional Forester.

FORPLAN - The forest planning model. A linear programming software package used to analyze planning decisions regarding land use patterns, capital investment, and timber harvest scheduling.

FUEL BREAK - A strategically located strip of land, usually 100 to 500 feet wide, that has been altered by removal of flammable vegetation so that fires burning into it can be more readily extinguished.

FUELS - Anything within the Forest that will burn. Usually live and dead woody vegetation (e.g., grass, shrubs, trees).

FUEL TREATMENT - The rearrangement or disposal of fuels to reduce the fire hazard.

GEOMORPHIC - Of, or pertaining to, the form of the earth, or its solid surface features.

GEOTHERMAL - Of, or pertaining to, the heat of the earth's interior.

GOAL - A concise statement that describes a desired condition to be achieved sometime in the future. It is normally expressed in broad, general terms and is timeless in that it has no specific date by which it is to be completed. Goal statements form the principal basis from which objectives are developed.

GOODS AND SERVICES - The various outputs, including on-site uses, produced from forest and rangeland resources.

GRAZING - Consumption of range or pasture forage by animals.

GRAZING SEASON - 1. A period of grazing to obtain optimum use of the forage resource. 2. On public lands an established period for which grazing permits are issued.

GREEN DOT SYSTEM - A seasonal vehicular management program which visually indicates travel routes open to public use; roads not identified by the green dot, and cross-country travel, are closed to public use during the designated time period.

GROUND WATER - Water in a saturated zone of a geologic stratum.

GROUP SELECTION - A modification of the selection system in which trees are removed in small groups at a time.

GUIDELINE - An indication or outline of policy or conduct that is not a mandatory requirement (as opposed to a standard, which is mandatory).

HABITAT - The sum total of environmental conditions of a specific place occupied by a wildlife or plant species or a population of such species.

HABITAT CAPABILITY INDEX (HCI) - A process used to determine habitat capability for big game by evaluating thermal cover and road density.
HABITAT DIVERSITY INDEX - A number that indicates the relative degree of diversity in habitat forest wide.

HABITAT EFFECTIVENESS (HE) - A combination of both quantity and quality of habitat, including both natural and introduced factors, which produces a specific habitat condition that either limits or generates habitat use by a wildlife species.

HARVEST CUTTING METHOD - The combination of management practices used to manipulate forest vegetation resulting in forests of distinctive form and character. Harvest cutting methods are classified as even-aged and uneven-aged.

HEEL PEACH - A mineral extraction process in which a solution (commonly cyanide solution) percolates through a pile (heap) of ore, dissolving the metal being extracted. The solution is collected after it percolates through the heap, and the metal is recovered from the solution. This is a common extraction process for low-grade deposits of gold, copper and silver.

HERBACEOUS - Having little or no woody tissue and persisting usually for a single growing season.

HIGH CLEARANCE VEHICLES - Motorized vehicles that can drive over minor obstacles because of their elevated frame.

HISTORIC - Refers to the period of time for which there are written records (after European contact). In Region 6, the historic era begins at roughly 1800 A.D, with the first explorers who kept journals.

HYDROLOGIC - Pertaining to the quantity, quality, and timing of water yield from forested lands.

HYDROPHOBIC - Lacking affinity for water.

HYDROTHERMAL - An adjective applied to heated or hot aqueous-rich solutions, to the process in which they are concerned, and to the rocks, ore deposits, and alteration products produced by them.

IGNEOUS ROCK - Rock formed by the crystallization of once molten material called lava or magma.

IMPLAN - A Forest Service input-output model that is an economic model which predicts the behavior of an economy as certain portions of the economy are altered.

IMPROVED ROAD - A constructed or maintained vehicle way for the use of highway-type vehicles having more than two wheels.

INDICATOR SPECIES - A plant or animal species so highly adapted to a particular kind of environment that its mere presence is sufficient indication that specific conditions are also present. (W-W DEIS).

INTEGRATED PEST MANAGEMENT (IMP) - A process for selecting strategies to regulate forest pests in which all aspects of a pest-host system are studied and weighed. The information considered in selecting appropriate strategies includes the impact of the unregulated pest population on various resource values, alternative regulatory tactics and strategies, and benefit/cost estimates for these alternative strategies. Regulatory strategies are based on sound silvicultural practices and ecology of the pest-host system and consist of a combination of tactics such as timber stand improvement plus selective use of pesticides. A basic principle in the choice of strategy is that it be ecologically compatible or acceptable.

INTENSIVE FOREST MANAGEMENT - A high investment level of timber management that envisions initial harvest, regeneration with genetically improved stock, control of competing vegetation, fill-in planting, pre-commercial thinning as needed for stocking control, one or more commercial thinnings, and final harvest.

INTERDISCIPLINARY TEAM - A group of individuals with different training assembled to solve a problem or perform a task.
INTERMINGLED OWNERSHIPS - Lands within the National Forest boundaries or surrounded by National Forest lands that are owned by private interests or other government agencies. Because of early land grants, these lands frequently are in checkerboard ownership patterns.

INTERMITTENT SERVICE - A road developed and operated for periodic service and closed between periods of use.

INTERPRETATION - Educational activity which aims to reveal meaning and relationships of the natural and cultural environment through first-hand experience.

IRRETRIEVABLE - Applies to losses of production, harvest, or use of renewable natural resources. For example, some or all of the timber production from an area is irretrievably lost during the time an area is used as a winter sports site. If the use is changed, timber production can be resumed. The production lost is irretrievable, but the action is not irreversible.

IRREVERSIBLE - Applies primarily to the use of nonrenewable resources, such as minerals or cultural resources, or to those factors, such as soil productivity, that are renewable only over long periods. Irreversible also includes loss of future options.

ISSUE - A point, matter, or question of public discussion or interest to be addressed or decided through the planning process.

J

JASPEROID - Agate, jasper, or thundereggs.

K

KNUTSON - VANDENBERG ACT OF 1924 (K-V) - An act that allows for the use of receipts for National Forest timber to reforest, to conduct stand improvement work or to perform improvement projects for other resources on the area where timber was harvested.

L

LAND ALLOCATION - The decision to use land for various resource management objectives in order to best satisfy the planning process issues, concerns, and opportunities, and meet assigned forest output targets.

LAND EXCHANGE - The conveyance of non-Federal land or interest in the land to the United States in exchange for National Forest System land or interest in the land.

LANDLINE LOCATION - Location of Forest property boundaries.

LIFESTYLE - A characteristic way of living which may be an individual variant within the cultural mainstream or may be an individual expression of a subculture.

LEASABLE MINERALS - Generally include minerals such as oil, gas, oil shale, coal, potassium, sodium, phosphates, sulphur, and geothermal.

LOCAL ROADS - Local roads are usually one-lane roads constructed to serve a dominant use or resource. Local roads do not access large land areas since they are more site specific than arterial and collector roads.

LOCATABLE MINERALS - These resources include gold, silver, lead, copper, and mercury, which are mined and processed for metals, and some uncommon nonmetals.
LOGGING SYSTEMS -

Tractor Logging - A system of log transportation in which logs are pulled from the woods to a landing by means of a crawler tractor, skidder, or similar ground-based equipment.

High-Lead Logging - A system of cable logging in which the working lines are elevated at the landing area by a rigged wooden tree or portable steel spar.

Skyline Logging - A system of cable logging in which all or part of the weight of the logs is supported during yarding by a suspended cable.

Balloon Logging - A system of cable logging in which the weight of the logs is counteracted by the lift provided by a lighter-than-air balloon.

Helicopter Logging - A system of transporting logs from the woods to a landing as an external load on a helicopter.

LONG-TERM EFFECTS - Those effects which will be significant beyond the RPA planning horizon of 50 years.

LONG-TERM SUSTAINED-YIELD TIMBER CAPACITY (LTSYC) - The highest uniform wood yield from lands being managed for timber production that may be sustained under a specified management intensity consistent with multiple-use objectives.

M

M - The Roman numeral for 1000.

MBF - One thousand board feet. Lumber or timber measurement.

MM - Million

MANAGED STAND - A stand of trees in which stocking level control is applied to achieve maximum growth.

MANAGED YIELD TABLE - A table showing, for a given species (or species mix) on a given site, the progressive development of a managed stand at periodic intervals covering the greater part of its useful life. It usually includes average diameter, basal area, number of trees, standing volume, and harvest volumes for a specific timber management regime.

MANAGEMENT AREA (MA) - A unit of land allocated to emphasize a particular resource, based on the capability of the area.

MANAGEMENT CONCERN - An issue, problem or a condition which constrains the range of management practices identified by the Forest Service in the planning process.

MANAGEMENT DIRECTION - A statement of multiple-use and other goals and objectives, the associated management prescriptions, and standards and guidelines for attaining them.

MANAGEMENT INDICATOR SPECIES (MIS) - A wildlife species whose presence in a certain location or situation at a given population level indicates a particular environmental condition. Population changes are believed to indicate effects of management activities on a number of other wildlife species.

MANAGEMENT INTENSITY - A management practice or combination of management practices and associated costs designed to obtain different levels of goods and services.

MANAGEMENT PRESCRIPTION - Management practices selected and scheduled for application on a specific area to attain multiple-use and other goals and objectives.
MANAGEMENT REQUIREMENT (MR) - Standards for resource protection, vegetation manipulation, silvicultural practices, even-aged management, riparian areas, soil and water and diversity, to be met in accomplishing National Forest System goals and objectives. (See 36 CFR 219.27)

MARGINAL COMPONENT - The portion of the commercial forest land on which it is presently not feasible (economically or technologically) to manage for timber crops but on which it may be possible in the future.

MASS-WASTING - A general term for a variety of processes by which large masses of earth material are moved by gravity either slowly or quickly from one place to another. (Dictionary of Geological Terms) Also mass movement.

MAXIMUM MODIFICATION - See "Scenic quality Objectives.*

MEAN ANNUAL INCREMENT (MAI) - The total increment up to a given age divided by that age.

MEMORANDUM OF AGREEMENT (MOA) - A three-party agreement (responsible Forest Service Official, State Historic Preservation Officer, Executive Director of the Advisory Council on Historic Preservation) which documents an agreed-upon plan to mitigate a proposed project's adverse effect upon cultural resources listed on or eligible for the National Register of Historic Places.

METAMORPHIC ROCK - Rocks changed by heat and pressure causing recrystallization and loss of original characteristics.

MIDDLEGROUND - The visible terrain beyond the foreground where individual trees are still visible, but do not stand out distinctly from the stand. (See "Foreground" and "Background")

MINERAL DEVELOPMENT - The activities and facilities associated with extracting a proven mineral deposit.

MINERAL ENTRY - Filing a mining claim on public land to obtain the right to any minerals it may contain.

MINERAL EXPLORATION - The search for valuable minerals on lands open to mineral entry.

MINERAL RESERVE - That portion of a mineral resource from which a mineral commodity can be economically and legally extracted.

MINERAL RESOURCE - A concentration of naturally occurring solid, liquid, or gaseous materials in or on the Earth's crust in such a form that economic extraction of a mineral resource is currently or potentially feasible (BLM Manual 3031).

MINIMUM VIABLE POPULATION (MVP) - The low end of the viable population range.

MITIGATION - To moderate the force or intensity of environmental effects. To lessen or minimize an Adverse Effect upon a cultural resource listed on or eligible for the National Register of Historic Places. The two categories of mitigation most often used are project modification and data recovery.

MIXED CONIFER (MC) - A stand of coniferous trees with a mixture of species. Ponderosa pine will usually make up 25 percent to 75 percent of the species composition.

MODIFICATION - See "Scenic Quality Objectives.*

MONITORING - A process of collecting significant data from defined sources to identify departures or deviations from expected plan outputs.

MOUNTAIN PINE BEETLE - A small insect (1/8 - 5/8 inch) that bores into the tree's cambium and deposits its eggs. Larvae emerge from the eggs and feed upon the cambial layer and thus disrupt the tree's translocation of food. Frequent attacks on the host tree result in the tree's mortality.
MORTALITY - The volume of sound wood dying from natural causes during a specified period.

MULTIPLE-AGED STANDS - An intermediate form of stand structure between even-aged and uneven-aged stands. These stands generally have two or three distinct tree canopy levels occurring within a single stand.

MULTIPLE USE - The management of all the various renewable surface resources of the National Forest System so that they are utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; that some lands will be used for less than all of the resources; and harmonious and coordinated management of the various resources, each with the other, without impairment of the productivity of the land, with consideration being given to the relative values of the various resources, and not necessarily the combination of uses that will give the greatest dollar return or the greatest unit output.

NATIONAL ENVIRONMENTAL POLICY ACT OF 1969 (NEPA) - An act declaring a National policy to encourage productive harmony between man and his environment, to promote efforts which will prevent or eliminate damage to the environment and the biosphere and stimulate the health and welfare of man, to enrich the understanding of the ecological systems and natural resources important to the Nation and to establish a Council on Environmental Quality.

NATIONAL FOREST FUND (NFF) - An account that includes all receipts (to the U.S. Treasury) from proclaimed National Forests for timber, grazing, land use, power, minerals, and user fees.

NATIONAL FOREST MANAGEMENT ACT (NFMA) - A law passed in 1976 that amends the Forest and Rangeland Renewable Resources Planning Act and requires the preparation of Forest plans.

NATIONAL FOREST SYSTEM (NFS) LAND - Federal lands that have been designated by Executive order or statute as National Forests, National Grasslands, or Purchase Units, and other lands under the administration of the Forest Service, including Experimental Areas and Bankhead-Jones Title III lands.

NATIONAL RECREATION TRAILS - Trails designated by the Secretary of the Interior or the Secretary of Agriculture as part of the national system of trails authorized by the National Trails System Act. National Recreation Trails provide a variety of outdoor recreation uses in or reasonably accessible to urban areas.

NATIONAL REGISTER OF HISTORIC PLACES - A register of cultural resources of national, state, or local significance, maintained by the Department of the Interior.

NATIONAL WILD AND SCENIC RIVER SYSTEM - Rivers with outstanding scenic, recreational, geological, fish and wildlife, historic, cultural, or other similar values designed by Congress under the Wild and Scenic Rivers Act for preservation of their free-flowing condition.

NET PUBLIC BENEFIT - An expression used to signify the overall long-term value to the Nation of all outputs and positive effects (benefits) less all associated inputs and negative effects (costs) whether they can be quantitatively valued or not. Net public benefits are measured by both quantitative and qualitative criteria rather than a single measure or index.

NO ACTION ALTERNATIVE (Alternative A) - The most likely condition expected to exist in the future if current management direction were to continue unchanged.

NONCOMMERCIAL SPECIES - Species that have no economic values at this time nor anticipated timber value within the near future.

NONDECLINING EVEN FLOW - A policy governing the volume of timber removed from a National Forest, which states that the volume planned for removal in each succeeding decade will equal or exceed that volume planned for removal in the previous decade.
NONFOREST LAND - Land that has never supported forests and lands formerly forested but now developed for such nonforest uses as crops, improved pasture, etc

NONMARKET - (Noncash economic benefits). Products derived from National Forest resources that do not have a well-established market value, for example, wilderness, wildlife

NONPRICED OUTPUTS - Outputs for which there is no available market transaction evidence and no reasonable basis for estimating a dollar value commensurate with the market values associated with the priced outputs.

NONSTRUCTURAL RANGE IMPROVEMENT - Practices and treatments undertaken to improve range not involving construction of improvements (e.g., seeding, fertilizing, or prescribed burning).

OBJECTIVE - A concise, time-specific statement of measurable planned results that respond to pre-established goals. An objective forms the basis for further planning to define the precise steps to be taken and the resources to be used in achieving identified goals.

OBLITERATE - The action needed to close an unneeded road and return the land to production.

OFF-HIGHWAY TRAVEL MANAGEMENT OBJECTIVES - These objectives relate to the recreation opportunities for off-highway use on areas and trails on National Forest lands. The objectives, which include off-highway travel criteria, are developed from management area direction and access management objectives.

OFF-ROAD or OFF-HIGHWAY VEHICLES (ORV's or OHV's) - Any vehicle, including ATV's, which is restricted by law from operating on public roads reserved for general motor vehicle traffic.

OLD GROWTH STAND - An old-growth stand is defined as any stand of trees 10 acres or greater generally containing the following characteristics: 1) stands contain mature and overmature trees in the overstory and are well into the mature growth stage; 2) stands will usually contain a multilayered canopy and trees of several age classes; 3) standing dead trees and down material are present; and 4) evidence of man's activities may be present, but does not significantly alter the other characteristics and would be a subordinate factor in a description of such a stand.

OPERATION AND MAINTENANCE COSTS - Costs associated with operating and maintaining facilities, program management, and support costs associated with management of other resources.

ORE - A mineral deposit which can be extracted at a profit

ORV CLOSURE - An administration order closing a land area to specified types of off-road vehicle travel yearlong

ORV RESTRICTION - An administrative order restricting a land area to specified types of off-road vehicle travel during specific seasons or conditions

OUTPUT - The goods, end products, or services that are purchased, consumed, or used directly by people. Goods, services, products, and concerns produced by activities that are measurable and capable of being used to determine the effectiveness of programs and activities in meeting objectives. A broad term for describing any result, product, or service that a process or activity actually produces.

OVERMATURE - The stage at which a tree declines in vigor and soundness, for example, height growth has usually stopped and probability of mortality is high
OVERSTORY - The portion of trees in a forest which forms the upper most layer of foliage.

OVERSTORY REMOVAL - A type of harvest which is designed to remove all of the trees in the overstory. The objective is to release the acceptably stocked understory.

OVERVIEW - A report, based primarily on archival research, that organizes and summarizes cultural resource information from a particular National Forest or geographic area.

PACIFIC NORTHWEST REGION - A Forest Service organizational unit consisting of all the National Forests in Oregon and Washington.

PARTIAL CUT - Any cutting other than a clearcut. This may include thinning, selection shelterwood or an overstory removal.

PARTIAL RETENTION - See "Scenic Quality Objectives."

PERMITTED GRAZING - Use of a National Forest range allotment under the terms of a grazing permit.

PERSONS-AT-ONE-TIME (PAOT) - The number of people in an area or using a facility at the same time. Generally used as "maximum PAOT" to indicate the capacity of an area or facility to support peak usage within established user density standards and without degradation to biophysical resources.

PHYSIOGRAPHIC - Pertaining to physical geography.

PHYSIOGRAPHIC PROVINCE - Region of similar structure and climate that has had a unified geomorphic cycle.

PLANNING HORIZON - The overall time period considered in the planning process that spans all activities covered in the analysis or plan and all future conditions and effects of proposed actions which would influence the planning decisions.

PLANNING PERIOD - Generally one decade. The time interval within the planning horizon that is used to show incremental changes to yields, costs, effects, and benefits.

PLANNING RECORDS - A system that records decisions and activities that result from the process of developing a forest plan, revision, or significant amendment.

PLANT ASSOCIATION - Climax plant community type.

PLANT COMMUNITIES - A homogeneous unit in respect to the number and relationship of plants in the tree, shrub, and ground cover strata.

POTENTIAL YIELD - The maximum, perpetual, sustained-yield harvest attainable through intensive forestry on regulated areas considering the productivity of the land, conventional logging technology, standard cultural treatments, and interrelationships with other resource uses and the environment.

PRECOMMERCIAL THINNING - The practice of removing some of the trees less than merchantable size from a stand so that the remaining trees will grow faster.

PREHISTORIC - Relating to the period of time before written records (prior to European contact). In Region 6, before 1800 A.D., or before the advent of written records.

PRESCRIBED BURNING - Use of fire in forest management for hazard reduction and vegetative manipulation.
PRESCRIBED FIRE - A wildland fire burning under specified conditions which will accomplish certain planned objectives. The fire may result from either planned or unplanned ignitions. Plans for use of unplanned ignitions for this purpose must be approved by the Regional Forester.

PRESENT NET VALUE (PNV) - The difference between the discounted value (benefits) of all outputs to which monetary values or established market prices are assigned and the total discounted costs of managing the planning area.

PRESERVATION - See "Scenic Quality Objectives".

PRIMARY CAVITY EXCAVATOR - An animal that excavates a cavity in wood for nesting or roosting.

PRIME FARMLAND - All land which qualifies for rating as Class I or as Class II in the U.S. Soil Conservation Service land use capability classification.

PRIMITIVE ROADS - Roads constructed with no regard for grade control or designed drainage, sometimes by merely repeated driving over an area. These roads are single lane, usually with native surfacing and sometimes passable with 4-wheel drive vehicles only, especially in wet weather.

PROGRAMMED ALLOWABLE HARVEST - That part of the potential yield scheduled for harvest in a specific year. It is based on demand, funding, management needs and multiple use considerations and, as a consequence, may vary over time.

PUMICE - A volcanic glass full of cavities and very light in weight.

PYROCLASTIC ROCK - A rock consisting of unworked solid material explosively or aerially ejected from a volcanic vent.

PUBLIC ISSUE - A subject or question of widespread public interest relating to management of National Forest System.

PUBLIC PARTICIPATION - Meetings, conferences, seminars, workshops, tours, written comments, responses to survey questionnaires, and similar activities designed and held to obtain comments from the public about Forest Service planning.

PURCHASER CREDIT - Credit earned by the purchaser of a National Forest timber sale by construction of contract-specified roads. Earned purchaser credit may be used by the purchaser as payment for National Forest timber removed.

RANGE ALLOTMENT - A designated area available for livestock grazing upon which a specified number, kind of livestock and season of use may be grazed under a term grazing permit. The basic land unit used to facilitate management of the range resource on National Forest System and associated lands administered by the Forest Service.

RANGE CONDITION - The state or health of the range vegetation and soil to produce a stable biotic community based on the composition, density, and vigor of the vegetation and the physical characteristics of the soil. Condition is expressed as satisfactory or unsatisfactory.

RANGE IMPROVEMENT - Any structure or nonstructural improvement to facilitate management of rangelands or livestock.

RANGELAND - Land where the vegetation is predominantly grasses, grass-like plants, forbs, or shrubs suitable for livestock grazing and browsing.
RANGE MANAGEMENT - The art and science of planning and directing range use to obtain sustained maximum animal production, consistent with perpetuation of the natural resource.

RANGER DISTRICT - Administrative subdivisions of the Forest supervised by a District Ranger who reports to the Forest Supervisor.

RARE II - See Roadless Area Review and Evaluation II.

REAL DOLLAR VALUE - A monetary value which compensates for the effects of inflation.

RECONSTRUCTION - Road or trail construction activities which take place on an existing road or trail and raise the standard of the road or trail. This can include relocation of the facility in a completely new location.

RECREATION CAPACITY - The number of people that can take advantage of the supply of a recreation opportunity during an established use period without substantially diminishing the quality of the recreation experience of the biophysical resources.

RECREATION INFORMATION MANAGEMENT (RIM) - A computer oriented system for the organization and management of information concerning recreation use, occupancy, and management of National Forest land.

RECREATION OPPORTUNITY SPECTRUM (ROS) - Land delineations that identify a variety of recreation experience opportunities categorized into six classes on a continuum from primitive to urban. Each class is defined in terms of the degree to which it satisfies certain recreation experience needs, based on the extent to which the natural environment has been modified, the type of facilities provided, the degree of outdoor skills needed to enjoy the area, and the relative density of recreation use. The six classes are:

1. **Primitive** - Area is characterized by an essentially unmodified natural environment of fairly large size. Interaction between users is very low and evidence of other users is minimal. The area is managed to be essentially free from evidence of human-induced restrictions and controls. Motorized use within the area is not permitted.

2. **Semiprimitive Nonmotorized (SPNM)** - Area is characterized by a predominantly natural or natural-appearing environment of large size. Interaction between users is low, but there is often evidence of other uses. The area is managed in such a way that minimum on-site controls and restrictions may be present, but would be subtle. Motorized recreation use is not permitted, but local roads used for other resource management activities may be present on a limited basis. Use of such roads is restricted to minimize impacts on recreational experience opportunities.

3. **Semiprimitive Motorized (SPM)** - Area is characterized by a predominantly natural or natural-appearing environment of moderate to large size. Concentration of users is low, but there is often evidence of other users. The area is managed in such a way that minimum on-site controls and restrictions may be present, but would be subtle. Motorized recreation use of local primitive or collector roads with predominantly natural surfaces and trails suitable for motor bikes is permitted.

4. **Roaded Natural (RN)** - Area is characterized by predominantly natural-appearing environments with moderate evidence of the sights and sounds of man. Such evidence usually harmonizes with the natural environment. Interaction between users may be moderate to high, with evidence of other users prevalent. Resource modification and utilization practices can be used, but harmonize with the natural environment. Conventional motorized use is allowed and incorporated into construction standards and design of facilities.

5. **Rural (R)** - Area is characterized by a natural environment that has been substantially modified by development of structures, vegetative manipulation, or pastoral agricultural development. Resource modification and utilization practices may be used to enhance specific recreation activities and to maintain vegetative cover and soil. Sights and sounds of humans are readily
evident, and the interaction between users is often moderate to high. A considerable number of facilities are designed for use by a large number of people. Facilities are often provided for special activities. Moderate user densities are present away from developed sites. Facilities for intensified motorized use and parking are available.

6. Urban - Area is characterized by a substantially urbanized environment, although the background may have natural-appearing elements. Renewable resource modification and utilization practices are often used to enhance specific recreation activities. Vegetative cover is often exotic and manicured. Sights and sounds of humans are predominant on site. Large numbers of users can be expected both on site and in nearby areas. Facilities for highly intensified motor use and parking are available with forms of mass transit often available to carry people throughout the site.

RECREATION VISITOR DAY (RVD) - A measure of recreational use of an area. One recreation visitor day consists of 12 hours of recreation use of a site or area. Recreation visitor days are used as a recreation production or output capacity measure.

RECREATION WILDERNESS SPECTRUM (RWS) - This is associated with the recreation opportunity spectrum (ROS), a system used to classify or differentiate areas within wilderness to provide for a variety of management possibilities and wilderness opportunities. The objective of all classifications is to provide wilderness opportunities but to different degrees; from pristine to the semiprimitive transition.

REFORESTATION - The natural or artificial restocking of an area usually to produce timber and other wood products, but also to protect watersheds, prevent soil erosion, and improve wildlife, recreation and other natural resources. Natural reforestation includes site preparation to reduce competing vegetation and provide a mineral seed bed for seed provided by seed trees. Artificial reforestation is the planting of seedlings, cuttings or seeds by hand or mechanical means and may include site preparation.

REGENERATION CUT - The removal of trees intended for the purpose of assisting regeneration already present or to make regeneration of the stand possible.

REGION - The standard administrative unit of the Forest Service administered by a Regional Forester.

REGIONAL FORESTER - The official responsible for administering a single Region and preparing a Regional Guide.

REGIONAL GUIDE - The plan developed to meet the requirements of the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended, that guides all natural resource management activities and establishes management standards and guidelines for the National Forest System lands of a given region. It also disaggregates the RPA objectives assigned to the Region and to the Forest within that region.

REGULATIONS - Generally refers to the Code of Federal Regulations, Title 36, Chapter II, which covers management of the Forest Service.

REHABILITATION - Actions taken to protect or enhance site productivity, water quality, or other values for a short period of time.

RESEARCH NATURAL AREAS (RNA's) - An area set aside by the Forest Service to preserve a representative sample of an ecological community; primarily for scientific and educational purposes. Commercial exploitation is not allowed and general public use is discouraged.

RESOURCE - An aspect of human environment which renders possible or facilitates the satisfaction of human wants and the attainment of social objectives.

RESOURCE VALUES - The tangible and intangible worth of forest resources.

RESPONSIBLE LINE OFFICER - The Forest Service employee who has the authority to select and/or carry out a specific planning action.
RESTORATION - The long-term placement of land back into its natural condition or state of productivity.

RETENTION - A scenic quality objective which means human activities are not evident to the casual forest visitor.

REVEGETATION - The re-establishment and development of a plant cover. This may take place naturally through the reproductive processes of the existing flora or artificially through the direct action of man - reforestation or range reseeding.

RIGHT-OF-WAY - The right to pass through another person’s land as obtained by condemnation or purchase.

RIM - See Recreation Information Management.

RIPARIAN AREAS - The riparian ecosystem (area) is that land, next to water, where plants that are dependent on a perpetual source of water occur. Riparian sites include fluvial surfaces such as streambanks, active channel shelves, active floodplains, and overflow channels.

RIPRAP - A structure built of broken rock or other material used for protecting exposed soil from erosion along stream channels or road ditches.

ROAD DENSITY - The number of road miles per square mile of land area.

ROADLESS AREA - An area of undeveloped Federal land within which there are no improved roads maintained for travel by means of motorized vehicles intended for highway use.

ROADLESS AREA REVIEW AND EVALUATION (RARE II) - A comprehensive process directed by the Secretary of Agriculture to identify roadless and undeveloped land areas in the National Forest system and to determine their uses for either wilderness or other resource management and development and to determine areas that would require further planning to make such a decision.

ROADLESS ISLANDS - A roadless area that is surrounded by permanent waters, or that is markedly distinguished from surrounding lands by topographical or ecological factors such as precipices, canyons, thickets, or swamps.

ROAD MANAGEMENT OBJECTIVES - Road management objectives establish the intended purpose of an individual road based on management area direction and access management objectives. Road management objectives contain design criteria, operation criteria, and maintenance criteria.

ROS - See Recreation Opportunity Spectrum.

ROTATION AGE - The age of a stand when regeneration harvest occurs.

RPA - Forest and Rangeland Renewable Resources Planning Act of 1974.

ROCKHOUND - An amateur rock and mineral collector.

RVD - See Recreation Visitor Day.

SALEABLE MINERALS - Saleable minerals include common varieties of sand, stone, gravel, pumice, pumicite, cinders, and clay. In general, these minerals are of wide-spread occurrence and are of relatively low unit value. They are generally used for construction materials and for road building purposes. Saleable minerals, which have some property giving them distinct and special value, remain locatable. Before a deposit can be sold, a determination of "common variety" must be made by minerals staff and legal counsel.
SALVAGE HARVEST - Removal of dead or dying trees resulting from insect and disease epidemics or wildfire.

SANITATION HARVEST - Removal of dead or dying trees to prevent spread of insects or disease

SAWTIMBER - Trees that will yield logs suitable in size and quality for the production of dimension lumber.

SCENIC QUALITY OBJECTIVES - Categories of acceptable landscape alteration measured in degrees of deviation from the natural-appearing landscape.

1. Preservation - Ecological change only.
2. Retention - Human activities are not evident to the casual Forest visitor.
3. Partial Retention - Human activity may be evident, but must remain subordinate to the characteristic landscape
4. Modification - Human activity may dominate the characteristic landscape, but must, at the same time, follow naturally established form, line, color, and texture. It should appear as a natural occurrence when viewed in foreground or middleground.
5. Maximum Modification - Human activity may dominate the characteristic landscape, but should appear as a natural occurrence when viewed as background.

SCENIC RESOURCE - The composite of basic terrain, geologic features, water features, vegetative patterns, and land-use effects that typify a land unit and influence the visual appeal the unit may have for visitors.

SCOPING - Determination of the significant issues to be addressed in an EIS.

SEDIMENT - Solid material, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

SEDIMENTARY ROCK - A rock made up of sediment.

SEED CUT - Removal of mature trees near rotation age in a shelterwood harvest to permanently open the stand and prepare the site for regeneration from the seed trees left for that purpose.

SEEDLING/SAPLING - A forest successional stage in which trees less than five inches in diameter are the predominant vegetation.

SELECTION CUTTING - The annual or periodic removal of trees (particularly the mature), individually or in small groups from an uneven-aged forest to achieve the balance among diameter classes needed for sustained yields, and in order to realize the yield, and establish a new crop of irregular constitution. NOTE: The improvement of the Forest is a primary consideration.

SELECTION SYSTEM - A silviculture system in which trees in an uneven-aged stand are removed individually, here and there, from a large area each year in order to achieve a balance among diameter classes needed for sustained yield by selection cutting - ideally over a whole forest or working circle, but from practical considerations almost always over the annual coupes of cutting series; regeneration mainly natural and crop ideally all-aged.

SENSITIVE SPECIES - Plant or animal species which are susceptible or vulnerable to activity impacts or habitat alterations. Those species that are recognized by the Regional Forester as needing special management to prevent placement on Federal or State lists

SERAL - A plant and animal community which is transitional in stage of succession, being either short- or long-term. If left alone, the seral stage will pass, and another plant and animal community will replace it
SHELTERWOOD HARVEST - Silvicultural system used to harvest mature trees at rotation age in a series of preparatory, seed and removal cuts designed to regenerate a new even-aged crop under the shelter of the old crop.

SHORT-TERM EFFECTS - For timber management planning, those effects which will not be significant beyond the RPA planning horizon of 50 years, for DEQ water quality, short-term effects are defined as two days or less. Generally, short-term effects are within the planning period.

SIGNIFICANT - Meeting the criteria for inclusion on the National Register of Historic Places (same as eligible).

SILVICULTURAL SYSTEM - A management process whereby forests are tended, harvested, and replaced, resulting in a forest of distinctive form. Systems are classified according to the method of carrying out the fellings that remove the mature crop and provide for regeneration and according to the type of forest thereby produced.

SILVICULTURE - The science and art of growing and tending crops of forest trees to attain the desired level of marketable and unmarketable products.

SITE INDEX - A measure of the relative productive capacity of an area for growing wood. Measurement of site index is based on height of the dominant trees in a stand at a given age.

SITE PREPARATION - Removing unwanted vegetation and debris from a site and preparing the soil before reforestation.

SITE PRODUCTIVITY - Production capability of specific areas of land.

SKYLINE LOGGING - A system of cable logging in which all or part of the weight of the logs is supported during yarding by a suspended cable.

SLASH - Debris left after logging, pruning, thinning, or brush cutting, and large accumulations of debris resulting from windstorms. It includes logs, bark, branches, and stumps.

SMOLT HABITAT CAPABILITY INDEX (SHCI) - Smolt refers to the life history stage of anadromous salmonids in which physiological changes are taking place to adapt them for ocean survival and they are either migrating or will shortly migrate seaward. The three levels associated with this index are:

1. Existing SHC - The number of smolt being produced at the present time with existing escapement levels in existing freshwater habitat.
2. Potential SHC - The number of smolt that are capable of being produced assuming there is sufficient adult escapement to fully seed existing freshwater habitat.
3. Potential SHC with Full Enhancement - The number of smolt that are capable of being produced, assuming sufficient capital investments have been made to maximize the freshwater habitats and there is sufficient adult escapement to fully seed the existing and enhanced habitat.

SNAG - A nonliving standing tree. The interior of the snag may be sound or rotted.

SNAG LEVEL - The number of snags per unit of area by dbh. class selected as a management goal; the level is predicted on the theoretical number of snags per unit of area by diameter class needed to support nesting populations of woodpeckers at a selected density.

SOCIOECONOMIC - Pertaining to, or signifying the combination or interaction of, social and economic factors.
SOIL EROSION - The detachment and movement of soil from the land surface by wind, water, or gravity.

SOIL COMPACTION - Increase in soil bulk density.

SOIL PRODUCTIVITY - The capacity of a soil, in its normal environment, to produce a specific plant or sequence of plants under a specific system of management.

SOIL RESOURCE INVENTORY (SRI) - An inventory of the soil resource based on landform, vegetative characteristics, soil characteristics, and management potentials.

SPECIAL COMPONENT - The portion of the commercial forest land that needs special treatment of the timber resource to achieve other resource objectives (e.g., old growth, streamside protection, or visual corridors).

SPECIAL USE PERMITS - Permits and granting of easements (excluding road permits and highway easements) authorizing the occupancy and use of land.

STAND - An aggregation of trees occupying a specific area and sufficiently uniform in composition, age arrangement, and condition as to be distinguishable from the forest in adjoining areas.

STANDARD - Performance criteria indicating acceptable norms or specifications that actions must meet. A principle requiring a specific level of attainment, a rule to measure against.

STANDARD COMPONENT - The portion of the commercial forest land on which crops of industrial wood can be grown and harvested with adequate protection of the forest resources under the usual provisions of the timber sale contract.

STATE HISTORIC PRESERVATION OFFICER (SHPO) - An official appointed by the Governor of each State to direct implementation of the National Historic Preservation Act of 1966 and subsequent regulations and Executive Order. Responsibilities include: State-wide cultural resource inventory, development of a State Historic Preservation Plan, review of National Register of Historic Places nominations, administration of Federal historic preservation grants, and review of Federal undertakings which might affect cultural resources listed on or eligible for the National Register of Historic Places.

STOCKING - The degree of occupancy of land by trees as measured by basal area or number of trees and as compared to a stocking standard; that is, the basal area or number of trees required to fully use the growth potential of the land.

STOCKING LEVEL CONTROL - The process of maintaining the desirable number of trees to achieve optimum growth and management.

STREAMFLOW - The discharge of water from a watershed that occurs in a natural stream channel.

STRUCTURAL RANGE IMPROVEMENT - Improvement requiring construction or installation to improve the range, facilitate management, or control distribution and movement of livestock.

SUlTABILITY - The appropriateness of applying certain resource management practices to a particular area of land, as determined by an analysis of the economic and environmental consequences and the alternative uses foregone. A unit of land may be suitable for a variety of individual or combined management practices.

SUITABLE TIMBER LAND - Forested lands that are available for timber management because they have not been withdrawn because of Law or Regulation, where irreversible damage would not occur, and where regeneration can be assured.

SUMMER RANGE - A portion of the total range on which big game animals normally find food and cover during summer months.
SUNK FUNDS - Monies already invested.

SUPPRESSION - The action of extinguishing or confining a fire.

SUSTAINED YIELD - The achievement and maintenance in perpetuity of a periodic output of the renewable resources without impairment of the productivity of the land.

TARGETS - Objectives assigned to the Forest by the Regional Plan.

TECTONIC - Of, pertaining to, or designating the rock structure and external forms resulting from the deformation of the earth’s crust.

TEMPORARY ROADS - Temporary roads are low-level roads constructed for a single purpose and short-term use. Once use of the road has been completed, it is obliterated, and the land it occupied is returned to production.

THERMAL COVER - Cover used by animals to lessen the effects of weather; for elk the types of cover are:

- **Summer Range** - A stand of coniferous trees at least 40 feet tall with an average crown closure of 40 percent or more
- **Winter Range** - A stand of coniferous trees 10 feet or more tall with an average crown closure of 40 percent or more

THINNING - The practice of removing some of the trees in a stand so that the remaining trees will grow faster due to reduced competition for nutrients, water, and sunlight. Thinning may be done at two different stages.

1. **Commercial thinning** - Removing trees that have reached sufficient size to be manufactured into a product.
2. **Precommercial thinning** - Removing trees that are too small to make a merchantable product

THREATENED SPECIES - Any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range and which has been designated in the Federal Register by the Secretary of the Interior as a threatened species.

THRESHOLD - The point or level of activity beyond which an undesirable set of responses begins to take place within a given resource system.

TIERING - Refers to the coverage of general matters in broad environmental impact statements (such as national program or policy statements) with subsequent narrower statements or environmental analyses (such as regional or basin wide program statements or ultimately site-specified statements), incorporating by reference the general discussions and concentrating solely on the issues specific to the statement in question.

TIMBER - A general term for the major woody growth of vegetation in a forest area.

TIMBER CLASSIFICATION - Forested land is classified under each of the land management alternatives according to how it relates to the management of the timber resource. The following are definitions of timber classifications used for this purpose.

1. **Nonforest** - Land that has never supported forests and land formerly forested where use for timber production is precluded by development or other uses.
2. **Forest** - Land at least 10-percent stocked (based on crown cover) by forest trees of any size, or formerly having had such tree cover and not currently developed for nonforest use.
3  Suitable - Land to be managed for timber production on a regulated basis.

4  Unsuitable - Forest land withdrawn from timber utilization by statute or administrative regulation (for example, wilderness), or identified as not appropriate for timber production in the Forest planning process

5.  Commercial Forest - Forest land tentatively suitable for the production of continuous crops of timber and that has not been withdrawn.

TIMBER PRODUCTION - The purposeful growing, tending, harvesting, and regeneration of regulated crops of trees to be cut into logs, bolts, or other round sections for industrial or consumer use. The term "timber production" does not include production of fuelwood.

TIMBER SALE PROGRAM QUANTITY - This includes all volume expected to be offered for sale. This includes "green" material, salvage, firewood and miscellaneous products. This is used to measure attainment of RPA budgeted target.

TIMBER STAND IMPROVEMENT (TSI) - Management activities conducted in an immature stand to accelerate diameter growth and improve the form of the trees that remain.

TOLERANCE - The ability of a tree to grow satisfactorily in the shade of, and in competition with, other trees.

TONS OF SUSPENDED PARTICULATES - A measure of the amount of solid material contributed to the airshed by smoke.

TRAILHEAD - The parking, signing, and other facilities available at the terminus of a trail.

TRAIL VEHICLE - Vehicles designed for trail use that are 40 inches wide or less, such as bicycles, snowmobiles, trail bikes, trail scooters, and all-terrain vehicles.

TRANSIERTORY RANGE - Land that is suitable for grazing use of a nonenduring or temporary nature over a period of time. For example, on particular disturbed lands, grass may remain in the area for a period of time before being replaced by trees or shrubs not suitable for forage.

TRANSPORTATION SYSTEM - All existing and planned roads and trails needed to access the Forest.

TUFT - A rock formed of compacted volcanic fragments, generally smaller than 4mm in diameter.

UNDERSTORY VEGETATION - Grass, small trees, shrubs, and other plants found beneath the overstory (the trees comprising the forest).

UNEVEN-AGED MANAGEMENT - The application of a combination of actions needed to simultaneously maintain continuous high-forest cover, recurring regeneration of desirable species, and the orderly growth and development of trees through a range of diameter or age classes to provide a sustained yield of forest products. Cutting is usually regulated by specifying the number or proportion of trees of particular sizes to retain within each area, thereby maintaining a planned distribution of size classes. Cutting methods that develop and maintain uneven-aged stands are single-tree selection and group selection.

UNIT PLANS - Land management plans prepared for multiple use management of land and resources on portions (units) of the National Forests, which do not necessarily fully incorporate NFMA requirements. "Units" do not always follow National Forest boundaries and, in some cases, include parts of two or more National Forests.

UNPLANNED IGNITION - A fire started at random by either natural or human causes, or a deliberate incendiary fire.
UNREGULATED - Timber land not managed on a sustained yield basis, such as administrative sites, campgrounds, and experimental forests.

UTILITY AND TRANSMISSION CORRIDOR - A strip of land designated for the transportation of energy, commodities, and communications by railroad, State highway, electrical power transmission (69 KV or above), oil and gas and coal slurry pipelines 10 inches in diameter and larger, and telecommunication cable and electronic sites for interstate use. Transportation of minor amounts of power for short distances, such as short feeder lines from small power projects including geothermal or wind, or to serve customer subservice substations along the line, are not to be treated within the Forest Plan effort.

UTILIZATION STANDARDS - Standards guiding the use and removal of timber, which is measured in terms of diameter at breast height (d.b.h.), top diameter inside the bark (top d.i.b), and percent "soundness" of the wood

VIABLE POPULATION - The number of individuals of a species required to ensure the long-term existence of the species in natural, self-sustaining populations adequately distributed throughout their region.

VIEWSHED - The total landscape seen or potentially seen from all or a logical part of a travel route, use area, or water body.

WATERSHED - The area that contributes water to a drainage or stream

WETLANDS - Areas that are inundated by surface water or groundwater with a frequency sufficient to support, and under normal circumstances does or would support, a prevalence of vegetation or aquatic life that requires saturated or seasonally saturated soil conditions for growth and reproduction (Executive Order 11990).

WILD AND SCENIC RIVERS - Those rivers or sections of rivers designated as such by congressional actions under the 1968 Wild and Scenic Rivers Act, as wild, scenic, or recreational by an act of the Legislature of the State or States through which they flow. Wild and scenic rivers may be classified and administered under one or more of the following categories:

1. Wild River Areas - Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America

2. Scenic River Areas - Those rivers or sections of rivers that are free of impoundments, with watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.

3. Recreational River Areas - Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past

WILDERNESS - Areas designated by congressional action under the 1964 Wilderness Act. Wilderness is defined as undeveloped Federal land retaining its primeval character and influence without permanent improvements or human habitation. Wilderness areas are protected and managed to preserve their natural conditions, which generally appear to have been affected primarily by the forces of nature, with the imprint of human activity substantially unnoticeable; have outstanding opportunities for solitude or for a primitive and confined type of recreation, include at least 5,000 acres or are of sufficient size to make practical their preservation, enjoyment, and use in an unimpaired condition, and may contain features of scientific, educational, scenic, or historical value as well as ecologic and geologic interest.
WILDERNESS ACT - Establishes a National Wilderness Preservation System to be composed of Federally-owned areas designated by Congress, administered for use and enjoyment as Wilderness, the preservation of their wilderness character, and for the gathering and dissemination of information regarding their use and enjoyment as Wilderness.

WILDERNESS RESOURCE SPECTRUM (WRS) - Classification used to further divide a wilderness into zones based on degrees of primitiveness. Areas of the Ochoco Wilderness will be managed under two classes of the WRS system:

1. Primitive - characterized by an essentially unmodified environment. Concentration of users is low and evidence of human use is minimal. The area is managed to be essentially free from evidence of human-induced restrictions and controls.

2. Semiprimitive - characterized by a predominately unmodified natural environment of moderate size. The concentration of users is low, but there is often evidence of other users. The area is managed in such a way that minimum on-site controls and restrictions may be present, but are subtle.

WILDFIRE - Any wildland fire that is not a prescribed fire. All wildfires require suppression.

WILDLIFE - All nondomesticated mammals, birds, reptiles, and amphibians living in a natural environment, including both game species and nongame species. Animals or their progeny, which once were domesticated but escaped captivity and are running wild (i.e., feral animals), such as horses, burros, and hogs, are not considered wildlife.

WILDLIFE AND FISH USER DAY (WFUD) - One WFUD consists of 12 hours of recreation that is the result of fish or wildlife.

WILDLIFE HABITAT DIVERSITY - The distribution and abundance of different plant and animal communities and species within a specific area.

WINTER RANGE - A range, usually at lower elevation, used by big game during the winter months; usually smaller and better-defined than summer ranges.

WITHDRAWAL - The withholding of an area of Federal land from settlement, sale, location, or entry, under some or all of the general land laws for the purpose of limiting activities under those laws in order to maintain other public values in the area.

WORKING GROUP - Comprises those parts of a forest that have generally the same growth potential and management opportunities.

YARDING - The moving of logs from the stump where cut to a central concentration area or landing.

ZONE OF INFLUENCE - The geographic area where most, but not all, of the direct social and economic effects of the Forest and Grassland's management occur.

RECORD OF DECISION
For The
LAND AND RESOURCE MANAGEMENT PLAN
FINAL ENVIRONMENTAL IMPACT STATEMENT

OCHOCO NATIONAL FOREST
Crook, Grant, Harney, and Wheeler Counties, Oregon
and
CROOKED RIVER NATIONAL GRASSLAND
Jefferson County, Oregon

USDA Forest Service, Pacific Northwest Region

The decision represents a selection, and forthcoming implementation of the Land and Resource Management Plan for the Ochoco National Forest and Crooked River National Grassland, pursuant to regulations of the National Forest Management Act (NFMA), Title 36, CFR Pt. 219 and the National Environmental Policy Act (NEPA), Council of Environmental Quality, Title 40, CFR Pts. 1500-1508. The Plan approved and adopted by virtue of this decision document is Alternative I which is identified as the preferred alternative in the Final Environmental Statement.

The Plan decision(s) represents a series of interdependent, but separable, judgements, which are generally of a complex, technical or political nature. The decisions relate primarily to programmatic land and resource management allocations and accompanying standards and guidelines, which when viewed in total comprise the Forest and Grassland Plans.

Basic elements of the process and resultant decisions are summarily set forth herewith as a Record of Decision (ROD). These include:

- planning process, authorities, and requirements
- issues, including public responses
- identification of decision(s) and the decision rationale
- alternatives considered
- modification of final alternatives
- rationale for nonselection of alternatives
- compatibility with other agency goals and plans
- implementation schedules
- mitigation and monitoring processes for plan change or amendment
- appeal rights

A decision may be subject to administrative appeal pursuant to 36 CFR 217. Notice of appeal and statement of reasons must be in writing and submitted to the Chief of the Forest Service within 90 days from the date of publication of Notice of Availability in the Federal Register on September 15, 1989.

I encourage anyone who is concerned about the Ochoco National Forest or Crooked River National Grassland Plan, or decisions contained therein, to first see if concerns or misunderstandings may be resolved with the Forest Supervisor in Prineville, Oregon (Phone 503 447-6247) before submitting an appeal.

I. INTRODUCTION

This document, the Record of Decision (ROD), summarizes the decisions, pertinent information, and rationale for the selection of a Land and Resource Management Plan for the Ochoco National Forest and Crooked River National Grassland. It is required under the National Environmental Policy Act regulations 40 CFR 1500-1508. Its purpose is to clearly identify the decisions and intended action.

The development of Plans for the Ochoco National Forest and Crooked River National Grassland has progressed over a considerable amount of time. The completion of comprehensive land and resource management plans under the National Forest Management Act of 1976 (NFMA) is a significant and important event in the administration of the Forest and Grassland. The decisions represented therein were arrived at through a deliberative process in which available information, data, alternatives, and public comments were carefully weighed and analyzed.

After consideration of pertinent information, my decision is to implement Plans for the Forest and Grassland which are represented by Alternative I. The Plans will guide the management of the Forest and Grassland for the next 10-15 years. They will be amendable as described herein (pg ROD-2). Alternative I is described by the Final Environmental Impact Statement (FEIS) and by the Plans themselves.

PURPOSE AND NEED

AUTHORITIES AND PURPOSE

The Plans provide for the coordinated multiple-use management of the various resources and uses, including recreation, wildlife and fish, range, timber, watershed, minerals, and wilderness. The Forest and Grassland Plans and Environmental Impact Statement (EIS) were developed under the implementing regulations of the National Environmental Policy Act (NEPA), Council on Environmental Quality, Title 40, Code of Federal Regulations, Parts 1500-1508 (40 CFR 1500-1508); and the National Forest Management Act (NFMA), Title 36, Code of Federal Regulations, Part 219 (36 CFR 219).

The Plans are part of the framework for long-range planning established by the Forest and Rangeland Renewable Resources Planning Act (RPA), as illustrated below under tiering.

TIERING

Forest Service planning is a continuous, interactive process tiered (CFR 40 CFR 1508 28) to and carried out on organizational levels within the National Forest systems. These levels are:
WHAT THE FOREST AND GRASSLAND PLANS ARE

The Plans are strategies for managing the Forest and Grassland in an environmentally sound manner to produce goods and services in a way that maximizes long-term public benefits.

The Plans are part of the 50-year framework for long-range resource planning established by the Forest and Rangeland Renewable Resources Planning Act (RPA), and establishes general resource management direction for the next 10 to 15 years. These decisions are given on pp. ROD 20-39. Information about outputs and effects beyond this time are projected only to indicate the anticipated consequences over time. The Plans will ordinarily be revised on a 10-year cycle or at least every 15 years. The Plans may be revised sooner if the Forest Supervisor determines that environmental conditions or resource demands have changed significantly, or if national policies, goals, or objectives have changed in a way that would require Forest Plan revisions.

Once adopted, the Plans supersede or bring into compliance all previous resource management plans prepared for the Forest and Grassland, subject to existing rights, contracts, and specific direction for areas such as Wilderness, Wild and Scenic Rivers, National Recreation Areas, and National Trails. This will generally be done within three years (see Table 1, pg ROD-4). Congressional land designations, catastrophic events, or major new management or production technologies may require the Plans to be amended or revised.

All activities, many of which are interdependent, may be affected by annual budgets. The Plans are implemented through various site-specific projects, such as the building of a road, the development of a campground, or the sale of timber. If the budget changes for any given year, the projects scheduled for that year may have to be rescheduled. However, the goals and land activity assignments described in the Plans would not change unless the Plans themselves were changed. If budgets change significantly over a number of years, the Plans may have to be amended and consequently, would reflect different target outputs and environmental conditions. The significance of budget-related or other changes is determined in the context of the particular circumstances.

The decision to adopt these Plans authorizes their implementation. During implementation, all specific projects and activities will be evaluated with respect to Plan direction and with appropriate public involvement. Schedules of proposed and possible projects are contained in the Plans, Appendices A. Public involvement and participation will continue as the Plans are implemented, because responsiveness to changing public issues will continue. These Plans and accompanying Environmental Impact Statement are for the most part programmatic. During implementation, when the various projects are designed, site-specific plans and analyses are performed. These analyses may result in environmental assessments, environmental impact statements, or categorical exclusions, and possibly an amendment or revision of the Forest or Grassland Plan. Any resulting NEPA documents are to be tiered to the Final Environmental Impact Statement for these Plans, pursuant to 40 CFR 1508.28.

AMENDMENTS

The Plans can be amended at any time. Amendments can be either "significant" or "non-significant" depending on the timing or location of the proposed change, and whether the change alters the goals, objectives, outputs, or management prescriptions. Amendments may be made to respond to changing needs, opportunities, monitoring, Congressional land designations, or catastrophic events (such as major floods or fires), or to take advantage of major new management or production technologies. If the change is not significant, the Forest Supervisor may implement the amendment following appropriate public notification and satisfactory compliance with environmental policies and procedures. If the change is significant, the Plan must be revised by the same process used to develop and approve the original Plan (see Amendment and Revision Process, p. ROD-59).
WHAT THE PLANS ARE NOT

The Land and Resource Management Plans are not plans for the various administrative activities needed to carry on the Forest Service’s day-to-day internal operations. For example, the Plans do not address personnel matters, law enforcement, fleet equipment, or internal organization changes.

The emphasis of the Plans is not on site-specific decisions or specific resource outputs. Instead, the emphasis is on applying various general management practices and intensities (standards and guidelines) to different land areas (allocations) to achieve multiple use goals and objectives in a cost-efficient manner.

While all the outputs in the Plans can be accomplished from a physical, biological, economic, social, and legal perspective, there is no guarantee that these levels will be accomplished. The outputs proposed by the Plan are estimates based on available inventory data and assumptions, and their accomplishment is subject to the annual budget received by the Forest. For example, the actual timber quantity sold or cut can depend on external factors beyond the scope of the Forest Plan. Local demand for raw materials, timber imports and exports, national housing starts, and home mortgage rates are among the factors which may influence the annual timber volumes actually harvested or sold in any one year.

CONSISTENCY

The National Forest Management Act requires that all resource plans, permits, contracts, and other instruments for the use and occupancy of National Forest System lands be consistent with the Forest Plan (16 U.S.C. 1604(i)). All administration activities affecting the National Forest must be based on the Forest Plan (36 CFR 219 10(e)).

All outstanding permits, contracts, cooperative agreements and other instruments for occupancy and use of lands included in the Forest Plan will be brought into agreement with this Forest Plan, subject to the valid existing rights of the parties involved; this will be done as soon as practicable, and generally within three years of the date of this Plan (see Table 1, pg ROD-4).

Likewise, timber implementation plans such as the Forest Tree Improvement Plan, Seed Orchard Management Plan, and Tree Seed Inventory Plan will be brought into compliance with the direction contained in the Forest Plan within three years of Plan approval.

The schedule of timber sales offerings in Appendix A-10 of the Forest Plan will be updated at least annually. All timber sales offered and all stand management contracts issued after approval of the Forest Plan will be in compliance with direction contained in the Plan. Changes to existing contracts, including timber sales and other stand management projects, may be proposed on a case-by-case basis where overriding resource considerations are present. Otherwise, all existing contracts will be administered in accordance with original provisions.

RELATIONSHIP OF OTHER PLANS TO THE FOREST AND GRASSLAND LAND AND RESOURCE MANAGEMENT PLANS (LRMP)

The Plans serve as the primary land and resource management direction for the Ochoco National Forest and Crooked River National Grassland. All other land, resource, or functional plans are replaced or must be consistent with the direction in these Plans. A list of plans superseded or requiring modification by the LRMP’s are given in Table 1.

1/ These existing plans will be examined and updated or revised as necessary to be brought in conformance with the Forest Plan, or simply incorporated into the Forest Plan if no change is needed.

II. PUBLIC PARTICIPATION

ISSUE IDENTIFICATION

In Autumn of 1980, the Forest began the task of identifying issues to be addressed in Forest planning. Six meetings with key interest group leaders and individuals were held. In the meeting, 125 preliminary issues, concerns and opportunities (ICO's) were identified. By an iterative process with the public, and through mailings, media and meetings over the course of several months, these were consolidated into 12 major issues or "planning problems," which are (for more detail see FEIS Appendix A):

1. Timber supply and Forest management
2. Social and economic wants and needs of local communities
3. Livestock grazing and allotment management
4. Riparian area management
5. Transportation system
6. Big game habitat
7. Roadless areas and wilderness study areas

ROD - 4
8. Scenic or visual resources
9. Old growth forest
10. Fuelwood supply
11. Snag dependent wildlife
12. Winter sports

PUBLIC INVOLVEMENT ON THE DRAFT EIS/PLAN

Notice of availability was published in the Federal Register on September 12, 1986. Over 1,000 copies of the documents were distributed. Each document package contained a "Reviewer's Guide" and "Summary." See Table 2 for the summary of public involvement efforts for the DEIS.

By the end of the 90-day review period, approximately 2,150 responses were received. All responses were acknowledged with reply cards. Table 3 gives the number of respondents favoring particular alternatives, and Table 4 shows the number of comments by subject area (for more detail see FEIS Appendix I).

* Respondents either preferred a particular alternative or a certain aspect of a particular alternative. Respondents who favored a new alternative other than those presented in the Forest Plan or by the timber industry totaled 65.

INTEREST GROUP METHODS

It appeared that the majority of respondents received their information primarily from fliers, media, or individuals rather than by reading the documents.

The forest products industry printed and distributed a leaflet entitled, "Ochoco Forest Plan to Take Millions of Dollars In Income from County Residents." On one side of the leaflet was a summary of industry's view of the Proposed Plan, including discussion of an industry-supported alternative, "B-plus." On the backside was a response form, consisting of seven multiple-choice options and a
space to write in a short comment. The form was preaddressed to the Ochoco National Forest, allowing a respondent to comment on the Plan by simply checking a few blanks and affixing a postage stamp. Mill managers held meetings in which employees were asked to fill out the form. An individual was contracted by industry to conduct meetings and distribute materials representing their viewpoint. This individual conducted 25-30 meetings, personally distributed 3,000 industry leaflets, and 700 copies of his speech. Other timber industry representatives also conducted meetings or presented information at local civic, business, and other organizational meetings.

Early in the process, analysts from the Northwest Forest Resources Council (NFRC) and timber industry lobby group, met with the Ochoco's planning analyst. Disagreeing with how job multipliers were expressed, they charged that job losses were understated. They used the potential yield from the Forest's 1980 timber plan as the basis for their economic arguments. A letter requesting withdrawal of the DEIS and Proposed Forest Plan was sent to the Regional Forester by a representative of the NFRC.

The Central Oregon Economic Development Council contracted Brian Long, an Economist from Seattle, to review the Forest's economic analyses and Impact Planning (IMPLAN) modeling and data. Long prepared a report in which he showed a loss of 317 jobs and 6.5 million dollars due to the Draft Preferred Plan. Long's findings, displayed in a 38-page report entitled "Economic Impact Analysis of the United States Forest Service Proposed Plan for the Ochoco National Forest in the Central Oregon Area," were presented to local community leaders and organizations.

A coalition of eight environmental groups published and distributed 8,500 copies of a flier entitled, "There Is Still Time to Save the Ochoco." The flier included information on the planning process and issues, and offered suggestions on how to respond to the issues. Environmentalist's views of the Proposed Plan were also presented at a public meeting in Bend, on radio and television talk shows, and in newspaper articles.

Two other special interest campaigns included: a statewide drive by snowmobile organizations to keep the Forest open to snowmobiles (particularly Lookout Mountain), and the elderly citizen's desire to re-open the road to the summit of Lookout Mountain.

The Northwest Forest Resources Council filed two appeals in May 1986, requesting that the management requirements incorporated into planning processes be reviewed, and that a no action alternative representing current management plans be included in the EIS. The Forest responded by preparing and issuing a supplement to the DEIS in the fall of 1988 addressing those issues.

The environmental community continued to prepare and circulate brochures and articles in recreation guides on Lookout Mountain. One such brochure appeared in April 1989, by "Friends of Lookout" entitled, "Accept an Invitation...Lookout Mountain Special Management Area." The purpose of this brochure was stated, "to protect the Lookout Mountain Area."

**SUMMARY OF PUBLIC COMMENT ON THE SUPPLEMENT TO THE DEIS**

The responses received on the Supplement to the DEIS were predominately local in origin. Ninety percent were form letters which came from local mills or mill owners. The form letters stated that they had "no major comments on the Supplement to the DEIS itself," but went on to repeat issues the mills and timber industry emphasized concerning the Draft - timber supply and jobs. Over 95% of the comments received on the Supplement to the DEIS did not respond to the issues addressed by the Supplement. Of those comments received on the NFMA management requirements incorporated by process, about half indicated the procedure was appropriate, while the others (from the timber industry, whose issue it was) disagreed with the process and cost of the requirements in terms of timber supply. The no change alternative was recognized by most commentators as not meeting the requirements of law, particularly NFMA, and therefore not being a viable implementable alternative.

**ISSUE AND PUBLIC RESPONSE SUMMARY**

**TIMBER SUPPLY AND FOREST MANAGEMENT**

Sub-issues relating to timber supply and forest management have been identified and are discussed separately.
Timber Supply and Sustained Even-flow Yield

Forest products manufacturing is the major industry of the area. Timber accounts for over 95% of the National Forest receipts. The Forest has 6.3 BBF of standing crop, approximately 49% of which is comprised of mature ponderosa pine.

There are 533,177 acres of forest land tentatively identified as suitable for timber production. The Forest Plan allocates 496,850 acres to general forest, 92,200 acres to nontimber uses such as wildernesses, roadless areas, old growth, and 255,590 acres to other management areas.

Large fine-grained ponderosa pine is the most commercially valuable tree in central Oregon. Open, park-like stands of mature ponderosa pine are also what people identify the Ochoco National Forest with and seek out for recreational purposes. Local mills are tooled for large material, although some modification has begun. Ponderosa pine may occur in relatively pure stands generally on relatively low productivity sites, or associated with other conifer species. The latter are referred to as mixed conifer stands and generally occupy the better sites, but existing mixed conifer stands have a high incidence of insect and disease damage, which reduces value and silvicultural options.

The 1979 Forest Timber Resource Plan established a potential yield of 136.5 MMBF. The programmed harvest for the Forest, under that plan, has been 129.8 MMBF. The present planning effort developed alternative first decade allowable sale quantities for the DEIS, ranging from 13.9 MMCF (82 MMBF) to 24.4 MMCF (146 MBBF). Three of the alternatives, including the draft preferred with an ASQ of 123 MMBF, plus an additional 5 MMBF in salvage sales, were departures. Yield or an ASQ exceeding 100 MMBF is not sustainable in BF measure over time. Because FORPLAN yields were all calculated in cubic feet, sustained yield in board feet was not readily determinable. The current net annual growth estimated in board feet for the Forest is about 80 MMBF. The harvest on the Forest has been at a historic high, e.g., 153 MMBF in 1985. This high level of harvest was a result of the combination of timber availability and a strong market.

Mill capacity of Crook and Harney Counties alone is estimated to be 385 MMBF annually. Demand for timber currently exceeds supply. The Forest has sold an average of 137 MMBF per annum over the past decade, and cut 110 MMBF of which 75% was ponderosa pine. Silvicultural systems applied have been predominately even-aged. Intensive timber management and resultant industrial activity on the Forest has potential to conflict with or impact other resources. Conversely, land allocations for other purposes compete with timber interests, and other management requirements can constrain timber management activities and reduce potential yields.

What the respondents said:

Timber industry wanted an allowable sale quantity of 137 MMBF, which was the original 1979 Timber Resource Plan potential yield. They also asked for at least 100 MMBF of the allowable sale quantity (ASQ) to be in ponderosa pine. They attempted to show that the "commercial forest" landbase had been decreased through the suitability determinations and other land allocations in the Draft Plan. Timber industry also wanted a larger salvage program. The conservation community, on the other hand, thought the ASQ for the Forest should be about 90 MMBF. Both industry and the conservationists agreed on the desirability of a sustained even-flow yield, but disagreed on the level of yield feasible on a sustained basis.

Ponderosa Pine Management

Large ponderosa pine trees are an economically important forest resource. They are more valuable and important than other species or second growth. Wood product remanufacturing has been increasing and relies primarily on the high quality lumber milled from ponderosa pine. This industry is dependent on large pine (20-inch DBH or larger) that is relatively free of knots. The majority of pine grows on relatively low productivity sites producing less than 58 cubic feet/acre/year. A quality versus quantity situation exists. Current forestry practices include rapid liquidation of old growth pine stands, even-aged management, and emphasis on fiber (quantity) production. Strategies in the DEIS were designed to produce either maximum cubic foot timber volume on available lands or maximum PNV. These strategies resulted in harvesting stands at 90 to 100 years and producing trees no larger than 14 to 16 inches DBH.

What the respondents said:

Large ponderosa pine were viewed as a unique product of central Oregon. Small diameter second growth trees were not. The stumpage value of large ponderosa pine is many times greater than second growth. Some segments of the wood
products industry would like to know what the supply of pine will be over time in order to plan their business operations. Both industry and other publics do not like even-aged management in ponderosa pine. Both want "selection" harvests, but for different reasons. Intensive management on low productivity pine sites is said not to be appropriate. It was thought that ponderosa pine, because of its uses and the sites involved, should be managed on a board foot (not cubic foot) basis. It was suggested ponderosa pine be inventoried and managed separately, with a separate ASQ established for pine. The timber industry asked for a ponderosa pine ASQ of 100 MMBF annually.

Uneven-aged vs. Even-aged Silviculture

The use of clearcutting as a silvicultural system on the Forest has increased in the past decade. This is due to prescriptions in mixed conifer that favor more clearcutting, and increases in harvest levels as the economy recovered from the recession of the early 1980's. Overstory removal has been applied extensively in ponderosa pine. Clearcut acres under the Proposed Plan would start increasing in the second decade as overstory removal opportunities continue to be reduced and management intensity increases.

The harvest methods employed in FORPLAN modeling and yield tables in the Proposed Plan and alternatives were based on even-aged management. Uneven-aged management of ponderosa pine appears to be a viable alternative with offsetting advantages and disadvantages. Some limited uneven-aged management was programmed for certain management areas in the Proposed Plan.

What the Respondents Said

There was strong support for uneven-aged management by the public and forest industry (albeit, for different reasons) and support for incorporation of uneven-aged management into an alternative. Some publics see overstory removal as clearcutting. Uneven-aged management was perceived as a method to avoid clearcutting (see Clearcutting, this page) and to reduce conflicts with other resources.

Departure

This issue stems from the Draft Plan (Alternative E-Departure) proposal for an ASQ of 123 MMBF in the first decade, declining to 118 MMBF in the second decade, and 89 MMBF by the fifth decade (20.6 MMCF to 16.1 MMCF). This amounts to a 25 percent reduction over 5 decades. The intent of the departure was to maintain a high timber supply to support community stability during the first decade. The issue is, however, larger than that alone. None of the alternatives are sustainable in board feet over time. (See Ponderosa Pine Management issue for importance of board feet versus cubic feet, p. ROD 7-8.) It is apparent that the current harvest level in board feet will decline over time and a decision as to the rate and to what level over time is needed, i.e., a "glide path" or "stepping down."

What the Respondents Said

None of the respondents liked the idea of departure. Industry said they needed a dependable (and higher) supply of timber, especially to encourage new business to central Oregon. Conservationists said departure was a euphemism for rapid liquidation of old growth. The public, for the most part, asked for a "sustained yield" which they seem to equate with nondeclining even-flow. Some felt we were remiss in proposing anything but sustained yield (nondeclining even-flow).

Clearcutting

Of the approximately 35,000 to 40,000 acres currently under contract on the Forest, only about 15 percent are to be clearcut. However, the Forest program in near future years contains substantial acreages of clearcutting in mixed conifer stands. The Draft Plan proposed harvesting 1,444 acres (nine percent of total harvested acres), increasing to 2,208 acres (39 percent of total harvested acres) by the year 2030. Root rot and other insect and disease problems, plus slash disposal needs, make any type of partial removal impractical for most of the mixed conifer stands.

What the Respondents Said

There was almost unanimous opposition to clearcutting from industry, conservation groups, and members of the general public. Reasons cited included the adverse effects it has on other resources, the waste of fast-growing, younger stock and potential crop trees, and the destruction of advanced regeneration. The issue was posed as "clearcutting vs. selection." Some publics perceived overstory removal as clearcutting. Clearcutting ponderosa pine was simply not considered appropriate. Acceptance for clearcut-
ting in mixed conifer was conceded by industry. The uneven-aged issue is related to this issue.

SOCIAL AND ECONOMIC WANTS AND NEEDS OF LOCAL COMMUNITIES

Central Oregon’s economy is primarily based on its natural resources. Employment levels, community stability, ability to attract new industry and maintain the present, have been linked by some to timber supply levels. Our analyses show that the Forest can not continue to concurrently provide the same amount of timber and amenities over time as is currently provided. As a result, there is likely to be socioeconomic conflict under any alternative.

The issue, however, is not as direct as timber supply alone. Other factors, such as remanufacturing, material (log) transport into and out of the area, automation, market conditions, rate of liquidation of old growth, and ponderosa pine management affect jobs, employment levels, county receipts, community stability, and other businesses and industries that contribute significantly to the economic well-being of the communities.

What the Respondents Said

The forest products industry and many individuals were adamant in demanding a high timber supply to maintain the local economy and jobs. Others pointed out the short-sightedness of this viewpoint and suggested that the rapid conversion of old growth and shift to second growth/fiber management might not be positive in the long run. They believe the important resource is large ponderosa pine. Second growth pine is worth $40-60/MBF, old growth $100-300/MBF, so that even if the cut is significantly reduced, management for larger pine could contribute more to the economy. The issue is also interrelated with the departure, uneven-age, and ponderosa pine issues. Still others felt that the high harvest levels would result in the loss of amenity resources that are the reason many people choose to live, work, and recreate in central Oregon. Nearly all thought that a departure was extremely short-sighted.

LIVESTOCK GRAZING AND ALLOTMENT MANAGEMENT

The Forest and Grassland provide summer grazing for about 14,000 cattle and 3,500 sheep, or 75,000 AUM’s annually, involving 105 permittees. Changes in public perception about management of the Forest and Grassland in recent years have raised questions of possible conflict between livestock and big game, water quality, riparian conditions, fisheries, recreationists and reforestation. Grazing permit administration is tied by law to allotment plans, not the Forest or Grassland Plans.

What the Respondents Said

Strong criticism was expressed concerning our past performance in administering the grazing program. The public doubts that riparian conditions can be improved and livestock numbers increased simultaneously.

Some said that any significant reduction in livestock grazing would have an adverse effect on the socio-economic base of Crook, Harney, and Jefferson counties and eliminate currently viable ranching units, and still other respondents suggested that full utilization be made of all available forage.

Some respondents requested that additional data about current conditions be presented and that more detailed descriptions of the impacts of livestock use on other resources be provided.

RIPARIAN AREA MANAGEMENT

Approximately 20,240 acres, including 815 miles of streams, of the Forest and Grassland are considered the riparian influence zone. Riparian areas receive a disproportionate amount of recreation and grazing use. Our most productive timber sites also occur along stream bottoms. Approximately 6,650 acres of riparian area are considered to be in *poor* condition. Public attention for riparian area management and condition is increasing.

The Draft Plan proposed to manage 9,400 acres of streamside to achieve *excellent* conditions. Structural improvements were proposed to enhance these areas as follows: fencing, 255 miles; large woody debris placement, 14 miles; log weir construction, 300 acres, rock structures, 50 acres; and shrub plantings, 50 acres. The remaining 9,600 acres would be managed for *good* or *fair* condition.

What the Respondents Said

The public is concerned about the impact that grazing, timber harvest, and road building has on
riparian areas. Of particular concern is the proposed increase in livestock use of forage and skepticism over the Forest's ability to adequately manage riparian vegetation. The view was presented that all riparian areas should be managed in "good" or better condition. There seemed to be a perception that if riparian areas were in "good condition," there would not be much concern over whether the vegetation was used by livestock or not. Some livestock users recommended that where fencing is employed to manage riparian vegetation, the fenced units should be large enough to be managed as riparian pastures; others wanted more specifics on the proposed riparian program.

TRANSPORTATION SYSTEM

The transportation system on the Forest and Grassland totaled 4,554 miles of roads in 1985. About 833 miles (18 percent) are maintained for passenger car use, with the remainder maintained for high clearance vehicles. In the past, roads were constructed to relatively high standards. Recently, economic pressures and more rigorous analysis led the Forest Service to adopt lower road standards.

Under the Draft Plan, the number of miles of road maintained on the Forest and Grassland would decrease nominally in the future. Roads would be closed when needed to protect soil and water, prevent disturbance of big game, and limit investment loss. Closures may be seasonal or yearlong.

What the Respondents Said

There is strong opinion that road standards and road density are too high. Seasonal road closures for protection of big game, and road closure after completion of timber sales are generally supported by the public.

The timber industry suggested that the conflicts between roads and big game result from roads being open to use, rather than roads per se. They contend that the needs of big game could be served as well by closing roads as by leaving areas roadless.

BIG GAME HABITAT

The Oregon Department of Fish and Wildlife (ODFW) assigned management objectives of 2,600 elk and 22,600 deer to the Forest and Grassland. The Forest and Grassland have potential habitat to support larger populations of big game than these objectives.

The Draft Plan proposed management for big game habitat would be the primary emphasis on 227,700 acres (approximately 25 percent) of the Forest and Grassland. In these areas, open road density and cover would be managed for high quality big game habitat.

What the Respondents Said

Most desired a larger big game population than what the Draft Plan allowed. They would like more seasonal and permanent road closures. They felt all of the big game winter range should be managed for that purpose, and an increase in the cover-forage ratios for the general forest should be made.

ROADLESS AREAS AND WILDERNESS STUDY AREAS

The Draft Plan proposed managing Cottonwood Creek, most of Rock Creek, part of Silver Creek, and a small portion of Lookout Mountain for semiprimitive nonmotorized recreation (25,249 acres total). Green Mountain (7,000 acres) was proposed to be managed for semiprimitive motorized recreation.

The Oregon Wilderness Act of 1984 required the Forest Service to review the Deschutes Canyon-Steelhead Falls Wilderness Study Area (WSA) and make a recommendation in the Forest Plan. The Draft proposed a 5,200-acre wilderness (2,500 acres National Grassland, 2,660 BLM). The total WSA was 18,402 acres. Also, the portion of the Deschutes River flowing through the wilderness study area was being studied for classification under both state and federal wild and scenic river systems. The North Fork Crooked River WSA (1,125 acres) was identified as being part of a larger area over which the BLM had the lead.

What Respondents Said

Public response on this issue was very polarized. Many of those favoring maintaining areas as unroaded on the Forest requested that acreage in each be increased over what was proposed in the Draft Plan. Lookout Mountain was most strongly supported to remain roadless, followed by Rock Creek and Cottonwood Creek areas (Ochoco Canyons).
Those opposing roadless area management for recreation cited single-use management as the basis for their opposition, and grouped roadless areas with what they felt were other single-use areas, i.e., wilderness, research natural areas, and old growth.

Those commenting on the Deschutes Canyon-Steelhead Falls WSA favored expanding the wilderness to include more area if we were going to recommend wilderness. There were few comments received on the NF Crooked River WSA.

**SCENIC OR VISUAL RESOURCES**

The Draft Plan proposed managing 3,000 acres in the Bandit Springs area and a 7,000-acre area encompassing Crystal Creek, Walton Lake, Round Mountain, Lookout Mountain, Mount Pisgah, and East Point to protect the natural appearance of the landscape. Scenic corridors proposed totalled 52,000 acres, or about 50 percent of the potential roadside viewing of 106,700 acres.

What the Respondents Said

There were relatively few comments from the public on this issue. Most comments favored retaining Highway 26 as a scenic corridor. Some people felt that scenic corridors were just another means of reducing the timber base. The State of Oregon expressed strong concern over maintaining the visual character of the Ochoco Forest over time.

**OLD GROWTH FOREST**

The Draft Plan proposed to provide 26,340 acres specifically allocated (dedicated) to old growth management. Approximately 23,500 more acres of old growth were thought to be available in wilderness and unroaded areas.

The size and distribution of the areas managed for old growth habitat were designed to meet habitat requirements for the pileated woodpecker, a management indicator species.

What the Respondents Said

A great majority of those responding desired a larger allocation for old growth. Some also expressed interest in preserving old growth juniper habitat.

**FUELWOOD SUPPLY**

The Forest currently supplies about 10,000 cords of fuelwood per year. This is expected to decrease after a few decades as harvesting is done in younger stands that provide less cull material. There is a large amount of material currently not used because of poor access (distance from road, distance from town) and because of small size. The availability and location of fuelwood is related in part to the timber sale program. Fuelwood gathering often conflicts with leaving an adequate number of snags for wildlife.

What the Respondents Said

The people who use fuelwood for heating (which includes a majority of local residents) favored the continued availability or increase in availability of fuelwood.

**SNAG DEPENDENT WILDLIFE**

The Draft Plan proposed providing 55 percent of the potential snag habitat. Snag levels vary by management area, ranging from 40 percent in areas managed for timber production to 100 percent in wilderness and roadless areas. Fuelwood cutting and timber sales may not be leaving adequate supplies of snags.

What the Respondents Said

Most of the respondents on this issue wanted snags reserved for wildlife. There was concern that the Forest Plan did not adequately protect snag habitat and that too many snags would fall prey to woodcutters and commercial timber sales. Conversely, timber industry strongly requested an expanded salvage program, which could conflict with leaving snags or snag replacement efforts.

**WINTER SPORTS**

At present, most of the Forest, except for the cross-country ski trails at Bandit Springs, is open to winter recreation, including snowmobiling. The Draft Plan proposed closing the summit of Lookout Mountain (2,950 acres) to snowmobiling.

The greatest limitation to winter recreation on the Forest is the lack of access, which at present is provided almost entirely by roads plowed to access timber sales.
What the Respondents Said

The proposal to close Lookout Mountain to snowmobiling was strongly opposed by snowmobilers. This appeared to be the major issue concerning winter sports that surfaced in the public comments. In contrast, there was little support by cross-country skiers for closing Lookout Mountain, or other areas of the Forest, to snowmobiling. Staff observations of winter use of Lookout Mountain indicate that the conflict between skiers and snowmobilers is normally minimal, and that at present levels, both uses can be accommodated in the area. One suggestion was that separate trails to the top of Lookout Mountain be provided for skiers and snowmobilers.

ADDITIONAL ISSUES NOT IDENTIFIED IN THE ORIGINAL ICO'S

ANADROMOUS FISH

Anadromous fish were not identified as an issue in development of the DEIS and Proposed Forest Plan. Anadromous fish were identified as a concern by several individuals and groups, including a lengthy, technical response from the Columbia River Intertribal Fish Commission (CRIFC). Primary concerns included protection and enhancement of spawning habitat, and the adequacy of the monitoring schedule. Native American groups noted that treaties guarantee protection for anadromous fish habitat.

HISTORIC TRAIL PRESERVATION - SUMMIT TRAIL

This issue developed out of a separate study conducted during the interim between issuance of the DEIS/Plan and Final.1/ The Forest coordinated with the State Historic Preservation Office (SHPO) on details contained in the Final. This trail has been related also to other groups' proposals for an east-west intertie to a cross-state trail system.

OFF-ROAD VEHICLE (ORV) USE

This issue re-emerged during the issue/Final Plan validation phase. It was not evident as an issue in the Draft Plan phase. It is being addressed under Transportation System (pg ROD-26).

ROUND MOUNTAIN

The Oregon Natural Resources Council in comment on the Draft Plan asked that a recreation unit be established for the Round Mountain area. This issue was brought up again by one individual in the validation process (see Other Multiple Use Decisions, pg. ROD-38).

VALIDATION OF PUBLIC PARTICIPATION PROCESS

Incorporation of public involvement into the decisions being reached in the Final Forest and Grassland Plans has been an integral step as we have progressed from the draft documents released in September 1986. Significant steps were taken during the last year of final document preparation to insure that direction in the Final Plans responded accurately to comments received on the Draft. Meetings were held, and contacts made with selected groups, individuals, agencies and political leaders in order to:

- Validate public responses received during the process;
- Insure that we correctly interpreted what was said; and
- Insure that we did not miss something or overlook stumbling blocks towards successful implementation.

This networking followed our efforts in seeking broad public review of our draft documents. During the past year, meetings have been held with groups, agencies, citizens, and internally within the Forest Service organization.

In response to this effort, where it appeared appropriate, changes were made in the final planning documents. This was intended to strengthen the Plan decision and build a base of support for effective implementation (see pp ROD 40-49 for summary of changes).

III. DECISIONS

SUMMARY OF THE DECISION

My decision is to approve and adopt the Forest and Grassland Plans which accompany the Final EIS; this decision is referred to as Alternative I for the management of the Ochoco National Forest and Crooked River National Grassland.

In arriving at this decision, I reviewed the environmental consequences of the Plans and their alternatives. I gave particular attention to the responsiveness of the selected plans to the public issues and management concerns identified in development of the Final Plans. Land allocations and standards and guidelines developed through interdisciplinary team analysis and review, reflect public comment, inherent land and resource capabilities, and the laws and regulations under which the National Forest and Grassland are required to be administered. In my judgement, Alternative I represents an equitable treatment of all resource considerations, and provides for both monetary and non-monetary outputs in a balanced and environmentally sound manner. In that sense, Alternative I maximizes net public benefits over time.

ESTABLISHMENT OF FOREST AND GRASSLAND MULTIPLE USE GOALS

The Forest and Grassland Plans (Chapters 4) establish multiple use goals, objectives and desired future condition. The goals represent a summary of the standards and guidelines on page ROD 15 and are listed below.

The Grassland is administered under different laws than the National Forest, and in addition to the multiple use goals, has legislated primary goals which are.

1. Administer the National Grassland under sound and progressive principles of land conservation and multiple use, and promote the development of grassland agriculture and sustained-yield management of the forage, fish and wildlife, timber, water, and recreational resources.

2. Manage the National Grassland resources to maintain and improve soil and vegetative cover, demonstrate sound and practical principles of land use, and exert a favorable influence for securing sound land conservation practices on associated private lands.

In addition, the goals and objectives for the Grassland differ from those of the National Forest for the management of old growth and recreation. For those resources, the Grassland goals deal only with juniper, and desert and canyon environments respectively.

SUMMARY LISTING OF MULTIPLE USE GOALS FOR FOREST AND GRASSLAND

Air Quality - Comply with air quality laws and regulations and coordinate with appropriate regulatory agencies.

Biological Diversity - Maintain native, historic, and desirable introduced plant and animal species and communities, including those that may be threatened, endangered, or sensitive.

Cultural Resources - Locate, evaluate, protect, and mitigate if necessary, significant archaeological sites. Enhance and interpret selected sites for public education and enjoyment. Promote opportunities for academic research.

Facilities - Plan, construct, maintain, and manage Forest and Grassland facilities to provide maximum economy, investment protection, user safety, and resource protection.

Fire - Control wildfire aggressively (particularly in urban-Forest interface areas), and in a cost-effective manner (minimize suppression cost plus loss).

Provide for the ecologically sound use of prescribed fire as a cost-effective management tool for achieving resource management objectives.

Forage - Provide forage for wildlife and domestic livestock, in a manner consistent with other resource objectives and environmental constraints, while maintaining or improving ecological condition and plant community stability.

Forest Health - Maintain health of the Forest for present and future uses. Forest health is defined as a desired condition where biotic and abiotic influences on the Forest (i.e. insects, diseases, atmospheric disposition, silvicultural treatments,
harvesting practices) do not threaten management objectives either now or in the future.

**Forest Residues** - Manage forest residues (woody biomass), resulting from either natural or man-caused processes, as a separate resource. Provide this resource (on-site) for the benefit of other resources such as soil, water, wildlife, and timber, as well as for the social and economic benefits associated with firewood gathering and other family oriented endeavors centered around residues (Regional Policy - FSM 2403).

**Fuelwood** - Provide fuelwood for personal and commercial use, consistent with other resource objectives and environmental constraints.

**Lands** - Permit special land uses that have been evaluated in relationship to land management objectives, are harmonious with other resource objectives and environmental considerations, and are in the public interest.

**Minerals and Energy** - Provide for and facilitate the exploration, development, and production of mineral and energy resources in coordination with other resource objectives, environmental considerations, and mining and leasing laws.

**Old Growth** - Provide stands of old growth throughout the Forest for wildlife habitat, ecosystem diversity and aesthetic diversity.

**Recreation** - Emphasize the National Recreation Strategy.

Provide for a variety of recreational experiences across all areas of the Ochoco National Forest, consistent with other resource objectives and environmental constraints.

Protect unique natural and recreational features.

**Scenic Resources** - Participate in the "National Forest Scenic Byways" program through nomination of Forest roads that exhibit exceptional qualities and meet national selection criteria.

Provide natural-appearing scenery along major travel ways, at developed and dispersed recreation sites, and at certain recreation areas.

Integrate visual quality management into all resource activities which have potential negative impacts on scenery.

**Social and Economic** - Manage the Forest to lend support to the social and economic viability of local communities, as well as to the nation as a whole.

Provide equal opportunities to people regardless of race, color, creed, sex, marital status, age, handicap, religion, or national origin.

**Soil** - Manage soil to maintain, restore, or improve its natural productive potential, balanced with resource demands over the long term.

**Timber** - Provide for the optimum production of quality wood products, consistent with other resource objectives, environmental constraints, and economic efficiency.

**Transportation System** - Plan, design, operate and maintain a safe and economical transportation system providing efficient access for the movement of people and materials involved in the use and protection of the National Forest lands.

**Water** - Maintain or improve water quality and quantity, and timing of run-off.

Comply with the objectives of the "Clean Water Act" and Oregon State water quality standards.

Provide water of consistently high quality to users and dependent resources.

**Wildlife and Fish** - Provide, manage and improve fish and wildlife habitats to maintain viable populations of existing native and desired non-native vertebrate species, including threatened, endangered, and sensitive species.

**ESTABLISHMENT OF MANAGEMENT REQUIREMENTS (STANDARDS AND GUIDELINES) AS LISTED IN CHAPTERS 4, FOREST AND GRASSLAND PLANS**

Specific direction for the management areas is provided for in Chapters 4 of the Plans as desired condition statements (prescriptions) and as Forest- and Grassland-wide and management area standards and guidelines. A summary of this information for the Forest and Grassland Plans follows:
NATIONAL FOREST

Management Area Prescriptions
(Forest Plan, Chapter 4 - Section 2)

F1. Black Canyon Wilderness
F2. Bridge Creek Wilderness
F3. Mill Creek Wilderness
F4. North Fork Crooked River Wilderness Study Area

LAND ALLOCATIONS AND PLAN STRUCTURES

The Plans establish land allocations which apply to specific uses, resource considerations, natural features or legislatively designated areas. The
allocations are mapped (see Alternative I maps depicting management areas) and have had preliminary ground truthing.

The management area allocations for the Forest and Grassland are summarized in Tables 5 & 6. Summary of percent area by resource emphasis is presented in Tables 7 & 8. Objectives and desired future condition have been described by management area in Chapters 4, Forest and Grassland Plans, and in the FEIS Chapter 2 and Appendix B. The management areas are individually described in summary form on pages ROD 18-20 (see also Alternative I maps).

**SUMMARY DESCRIPTION OF DIRECTION FOR MANAGEMENT AREAS**

**MA-F1 BLACK CANYON WILDERNESS** - Protect the wilderness ecosystems. Manage use to maintain a natural setting and preserve solitude.

**MA-F2 BRIDGE CREEK WILDERNESS** - Protect the wilderness ecosystems. Manage use to maintain a natural setting and preserve solitude.

**MA-F3 MILL CREEK WILDERNESS** - Protect the wilderness ecosystems. Manage use to maintain a natural setting and preserve solitude.

**MA-F4 NORTH FORK CROOKED RIVER WILDERNESS STUDY AREA** - Management will maintain the existing conditions of the area for potential wilderness designation pending a decision by Congress or until released from further consideration.

**MA-F5 RESEARCH NATURAL AREAS** - Provide opportunities for research, education, and ecological benchmarks in naturally occurring ecosystems where natural processes are maintained.

**MA-F6 OLD GROWTH** - Provide habitat for wildlife species dependent on old growth stands and protect old growth itself.

**MA-F7 SUMMIT HISTORIC TRAIL** - Protect the integrity of the Summit Trail. Enhance and interpret significant segments for public enjoyment and education. Pristine segments will be managed to protect, interpret, and preserve their historic qualities.

**MA-F8 ROCK CREEK/COTTONWOOD CREEK ROADLESS AREA** - Provide for protection of soil, water, and fisheries, and for opportunities for nonmotorized recreational use and enjoyment. Maintain vegetation on steep slopes to prevent erosion, and to protect water quality and the anadromous fishery.

**MA-F9 ROCK CREEK/COTTONWOOD CREEK UNROADED HELICOPTER AREA** - Allow timber harvest while protecting the anadromous fishery, sensitive soils on steep slopes, and big game habitat.

**MA-F10 SILVER CREEK ROADLESS AREA** - Protect and enhance the roadless qualities and provide nonmotorized recreational use.

**MA-F11 LOOKOUT MOUNTAIN RECREATION AREA** - Maintain a natural setting, providing continued opportunities for high quality, semiprimitive recreational activities, and wildlife habitat, while maintaining healthy forests.

**MA-F12 EAGLE ROOSTING AREAS** - Provide winter roosting habitat for migrating bald eagles during the period December through April, annually.

**MA-F13 DEVELOPED RECREATION** - Provide safe, healthful, and esthetic facilities for people to utilize, within a relatively natural outdoor setting, while pursuing a variety of recreational experiences.
MA-F14 DISPERSED RECREATION - Provide and maintain a near-natural setting for people to utilize while pursuing outdoor recreation experiences.

MA-F15 RIPARIAN - Manage streamside vegetation and habitat in order to maintain or improve water quality, meeting temperature and turbidity levels as required by state standards under the Clean Water Act.

MA-F16 BANDIT SPRINGS RECREATION AREA - Dispersed, nonmotorized recreational opportunities, within a setting where management activities are generally not evident to the casual observer. The recreational activities and opportunities will be expanded beyond winter recreation to year-round activities.

MA-F17 STEIN'S PILLAR RECREATION AREA - Maintain a scenic, natural or natural-appearing setting associated with unique geologic formations, particularly Stein's Pillar. Provide roadless nonmotorized recreation, with various opportunities to enjoy nature.

MA-F18 HAMMER CREEK WILDLIFE/RECREATION AREA - Provide and maintain habitat diversity for a variety of wildlife species where open road density is minimal, and a scenic, semi-natural or natural-appearing setting for nonmotorized recreational opportunities exists.

MA-F19 DEEP CREEK RECREATION AREA - Provide a near natural setting, where management activities are not visually evident or subordinated to the surrounding landscape, for recreational pursuits within the area.

MA-F20 WINTER RANGE - Manage for big game winter range habitat.

MA-F21 GENERAL FOREST WINTER RANGE - Manage for timber production with measures taken to maintain habitat effectiveness for big game. Management activities will be designed and implemented to recognize big game habitat needs.

MA-F22 GENERAL FOREST - Production of timber and forage while meeting the Forest-wide Standards and Guides for all resources.

MA-F23 NORTH FORK CROOKED RIVER RECREATION CORRIDOR - Management will maintain the appearance of a natural landscape in the foreground view from Road 42 to enhance recreational and scenic values. Management activities will protect and enhance public use and enjoyment of the river segment.

MA-F24 NORTH FORK CROOKED RIVER SCENIC CORRIDOR - Management will maintain and enhance a natural appearing landscape and protect the scenic river designation.

MA-F26 VISUAL MANAGEMENT CORRIDORS - Maintain the natural appearing character of the Forest along major travel routes, where management activities are not evident, or are visually subordinated to the surrounding landscape.

MA-F27 ROUND MOUNTAIN NATIONAL RECREATION TRAIL - Protect and manage for scenic qualities which make the trail corridor an attractive recreational setting.

MA-F28 FACILITIES - Provide a safe, efficient, and healthful working environment where structure design and layout of the site blend with the surroundings.

MA-G1 ANTELOPE WINTER RANGE - Manage for optimum winter range conditions for antelope in conjunction with the Oregon Department of Fish and Wildlife.

MA-G2 METOLIUS DEER WINTER RANGE - Manage for big game winter range habitat.

MA-G3 GENERAL FORAGE - Manage for forage production and utilization in a manner consistent with Forest-wide Standards and Guides for other resources.

MA-G4 RESEARCH NATURAL AREAS - Provide opportunities for research, education, and ecological benchmarks in naturally occurring ecosystems where natural processes are maintained.

MA-G5 JUNIPER OLD GROWTH - Provide habitat for wildlife species dependent on old growth stands.

MA-G6 CROOKED RIVER RECREATION RIVER - Management will maintain the appearance of a natural landscape to enhance and protect recreational values.

MA-G7 DESCHUTES RIVER SCENIC CORRIDOR - Manage for scenic quality and natural appearance of the landscape.
MA-G8 SQUAW CREEK - Provide opportunities for semiprimitive nonmotorized recreation in a pristine canyon setting while protecting and enhancing the deer winter range habitat and fisheries. Includes a 1,370 acre segment of Lower Squaw Creek recommended for designation as a "scenic river" in the Wild and Scenic River System.

MA-G9 RIPARIAN - Manage streamside vegetation and habitat in order to maintain or improve water quality, meeting temperature and turbidity levels as required by state standards under the Clean Water Act.

MA-G10 RIMROCK SPRINGS WILDLIFE - Provide unique habitat (wetlands, ponds, springs) within the juniper-sagebrush steppe, characteristic of Central Oregon's high desert. Provide for nonconsumptive (viewing, photography) wildlife uses in a natural setting.

MA-G11 HAYSTACK RESERVOIR - Provide users with a system of quality facilities that are safe and environmentally sound. Continue to emphasize camping, picnicking, boating, fishing, and swimming.

MA-G12 COVE PALISADES STATE PARK - Manage for developed campgrounds and water related recreational activities.

MA-G13 LAKE BILLY CHINOOK VIEW - Maintain the natural appearing character of the viewshed from Lake Billy Chinook, where management activities are not evident or are visually subordinated to the surrounding landscape.

MA-G14 DISPERSED RECREATION - Provide and maintain a near-natural setting for people to utilize while pursuing outdoor recreation experiences.

MA-G15 GRAY BUTTE ELECTRONIC SITE - Accommodate electronic transmission facilities. The site is limited to low power output electronic equipment.

MA-G16 UTILITY CORRIDORS - Accommodate energy-transmission facilities.

DECISIONS RELATED TO PLANNING ISSUES (ICO'S) AND THEIR DECISION RATIONALE

Decisions relating to each planning issue (see pp ROD 6-12 for summary description of issues) are listed and followed here by brief rationale for the decisions.

TIMBER SUPPLY AND FOREST MANAGEMENT DECISIONS

DECISIONS.

1. There will be no scheduled or chargeable timber harvest for the National Grassland.

2. The suitable land base for forest management activities within this planning period is determined to be 533,177 acres (as shown in FEIS Chapter 2, Table 2-8, and Appendix G in the Forest Plan).

3. Ninety percent or more of the physically suitable Forest acres will have a scheduled or chargeable timber harvest, based on the allocations described in FEIS Chapter 2, and displayed on the Forest plan map.

4. The estimated scheduled timber volumes, harvest type, rotation age or size, and estimated potential contribution to ASQ by management area grouping are

Group I
92,200 Acres - 11%
No scheduled treatment

1. Black Canyon Wilderness
2. Bridge Creek Wilderness
3. Mill Creek Wilderness
4. N.F.C.R. Wilderness Study
5. RNA's
6. Old Growth
7. Summit Trail (preservation)
8. Rock Creek/Cottonwood Creek Unroaded
9. Silver Creek Unroaded
10. Eagle Roosting
11. Lookout Mountain
12. Facilities

Group II
18,130 Acres - 2%
Silviculture - Even- or uneven-aged
Rotation Age - 200 years
Diameter 20"+
Average annual cu ft volume - 0.3 MMCF
15. Riparian

Group III
3,240 Acres - <1%
Silviculture - Even- or uneven-aged
Rotation age - 300 years
Diameter 30"
Average annual cu ft yield - <0.1 MMCF
12. Eagle Roosting
17. Stein’s Pillar
19. Deep Creek
24. N F.C.R. Scenic River

Group IV
28,110 Acres - 4%
Silviculture - Even- or uneven-aged
Rotation age - Pine 250 years, mixed conifer 200 years
Average annual cu.ft. yield - 0.4 MMCF
  7. Summit Trail (retention)
  13. Developed Recreation
  14. Dispersed Recreation
  16. Bandit Springs
  25. Hwy 26 Corridor
  26. Visual Management (retention)
  27. Round Mountain National Recreation Trail

Group V
32,140 Acres - 4%
Silviculture - Even- or uneven-aged
Rotation age - Pine 200 years, mixed conifer 150 years
Diameter - Pine 27", mixed conifer 22"
Average annual cu.ft. yield - 0.6 MMCF
  7. Summit Trail (partial retention)
  18. Hammer Creek
  23. N F.C.R Recreation River
  26. Visual Management (partial retention)

Group VI
64,130 Acres - 8%
Silviculture - Even-aged
Rotation age - Pine 125 years, mixed conifer 90 years
Diameter - Pine 16", mixed conifer 15"
Average annual cu.ft. yield - 0.9 MMCF
  20. Winter Range

Group VII
606,690 Acres - 72%
Silviculture - Even- or uneven-aged
Rotation age - Pine 130 years, mixed conifer 90 years
Diameter - Pine 18", mixed conifer 16" (uneven-aged 20")
Average annual cu.ft. yield - 16.8 MMCF
  9. Rock Creek/Cottonwood Creek Helicopter
  21. General Forest Winter Range
  22. General Forest

5. The ASQ will be 19.0 MMCF per year which is sustainable in perpetuity. This translates to 115 MMBF average ASQ over the first decade of which an estimated 71 percent, or 82 MMBF, will be comprised of ponderosa pine volume.

6. The Forest will conduct a timber salvage program within the limits of requirements for other resource objectives, such as snags for wildlife habitat, dead and down material as it relates to site productivity and healthy stream ecosystems, and prevention of excessive soil compaction. The annual volume estimated to be available for salvage over the planning period is four MMBF annually of which three MMBF is ponderosa pine.

7. The Forest will employ appropriate silvicultural systems in Forest management based on project analysis of stand structures, stand conditions, species composition and management objectives (see FEIS, Appendix E). Either even-aged or uneven-aged systems may be prescribed. Clearcutting will be done where forest conditions, such as disease and insect infestation, allow no other silviculturally acceptable alternative. Such situations generally occur in mixed conifer stands or where ponderosa pine is heavily infested with dwarf mistletoe. Approximately 100,000 acres of ponderosa pine stands in the General Forest Management Area (MA-F22) will be managed under uneven-aged systems.

8. Ponderosa pine rotation age in the General Forest Management Area (MA-F22) will be 130 years with a tree diameter of 18 inches; for mixed conifer it is 90 years and 16 inches. Stands selected for uneven-aged management will have an average rotational diameter of 20 inches. Rotation ages in other management areas range from 90-300 years and are based on resource objectives (recreation, wildlife, visual emphasis - see item 4 under Decisions, p. ROD-20).

9. Changes in ASQ will be done gradually over time. Table 9 shows the proposed schedule.
TABLE 9
Planned Harvest For 1990-1999

RATIONALE

The intent is to maintain relatively high and sustainable level of allowable sale quantity and salvage program over the next decade in view of dependent communities and wood product demand; however this must be accomplished within the law and regulations, as well as requirements for other resources established by this Plan. In my judgement the combined ASQ and salvage of 119 MMBF annually, when all things are taken into consideration, is reasonable and attainable for the Ochoco National Forest for this planning period.

I have given particular attention to the amount of ponderosa pine that can comprise that volume on a sustainable basis and find it to be approximately 71%, or 82 MMBF for the first decade. Because of product value, considerations, and other resource objectives involved, I have elected to vary rotation ages (diameters) by species and situations in order to insure the continuation of high value products from the Forest, and perpetuation of the aesthetic forest character of the Ochoco National Forest The decision to apply uneven-aged management also relates to those reasons.

The combined ASQ and salvage volume of 119 MMBF is greater than the average annual historic volume of 110 MMBF cut over the past decade. However it is eight percent less than the volume sold, or 108 MMBF less than the programmed harvest allowed under the 1979 Timber Resource Plan. The differences in projections may be attributed to new inventory information; improved yield tables, and new allocations, laws, regulations and requirements affecting resource decisions. It is my intention to make these changes in timber availability in a gradual manner so as to cause minimal social or economic affects (see Table 9).

I have considered the potential for providing a higher ASQ should economics or demand continue to improve. Some additional ASQ (<3 MMBF) might be theoretically captured by further increases in management intensity and investment, but this is not presently cost efficient, as demonstrated by the PNV of Alternative 8-Modified vs Alternative I (Table 31). Because the forested lands on the Ochoco are for the most part "suitable" and cost-efficient under current economics, changes in demand do not affect ASQ by bringing more acres or situations into solution. In short, there is little potential for increasing ASQ on this particular National Forest due to improved economics at this time. Any such opportunities would contribute insignificantly to the ASQ as calculated and do not appear to be cost effective at this time.

SOCIAL AND ECONOMIC WANTS AND NEEDS OF LOCAL COMMUNITIES

DECISION

The decisions relating to this issue are addressed under the other issues and aspects of the Plan(s). These include, but are not limited to.

1. Allocations which recognize and protect important natural features, recreational attractions, wildernesses, and wildlife habitat.

National Forest - MA - 1,2,3,4,5,6,7,8,10,11,12,13,14,15,16,17,18,19,20,23,24,25,26,27

National Grassland - MA - 1,2,5,6,7,8,9,10,11,12,13,14

2. Allocations, decisions, and standards and guidelines (direction) which perpetuate the character of the National Forest and Grassland over time, e.g.

   a. Larger harvest tree diameters than those required to maximize timber outputs.

   b. Application of uneven-aged management.

   c. Roadside visual corridors.

   d. Protection of recreational features or attractions (Deep Creek, Stein's Pillar, NF.C.R Scenic River, et al)
3. Timber supply level of 119 MMBF (including salvage) in the first decade, with long-term sustained yield of 190 MMCF.

4. Consideration of product value in Forest management decisions; decision for larger rotational diameter for ponderosa pine and approximately 71 percent of the ASQ comprised of ponderosa pine.

5. Decisions affecting range allotments made on a case-by-case basis.

RATIONALE

Decisions under the issue of Timber Supply have the potential to have the greatest and most immediate effects on local communities. The importance of timber harvest levels to jobs is recognized, but decisions by industry (e.g. automation) also effect the number of jobs. The decision made in the plan purposefully provides a relatively high level of timber supply, with attention to the amount of ponderosa pine. Large ponderosa pine has the greatest value and its sale and manufacture potentially generates the greatest number of jobs and economic returns. The decision to plan for a smaller diameter for other species relates to current product demands, as well as silvics of the species. My decisions will provide a sustained, even-flow, of high value timber from the Forest on a decadal basis, while maintaining, protecting, or enhancing wildlife, recreation, water quality and visual resources. In my judgement, Final Plan decisions contribute to a balance between nonmonetary and monetary resources in a manner that can assist the economic stability of dependent communities, and allow the character and recreational settings relating to rural lifestyles carried on near the National Forest and Grassland to be maintained over time.

LIVESTOCK GRAZING AND ALLOTMENT MANAGEMENT DECISIONS.

1. Forage utilization standards for riparian and primary range are established as described in Table 10.

2. A prioritized program for improvement of riparian areas on an allotment-by-allotment basis has been developed (see Forest and Grassland Plans Appendix A) All riparian areas will have necessary action initiated within this planning period (10 years) to begin improvement of their condition to "Excellent."

3. Range allotment plans will be updated and tiered to the above program. Adjustments in permitted stock numbers will be made through the allotment planning process.

4. Fall green-up in Winter Range (MA-F20) and General Forest Winter Range (MA-F21) will be reserved for big game.

5. No domestic stock grazing will be permitted in lower Squaw Creek (MA-F8) from the power line crossing downstream to confluence of the Deschutes River, or on the Island RNA (MA-F4).

6. Interior portions of Rimrock Springs Wildlife Area (MA-F10) are not programmed for planned, recurrent grazing.

7. The current grazing program of 75,000 AUM's for the Forest and Grassland could be reduced by up to 10 percent during this planning period. This reduction would not be an across the board cut, but vary by the condition of the riparian areas within each allotment on a case-by-case basis. Over time, AUM's may increase depending on the effectiveness of the riparian improvement program.

RATIONALE

With the establishment of forage utilization standards it is my intent to assure that grazing levels on the National Forest and Grassland do not exceed the carrying capacity of plant communities, and to prevent deterioration of rangelands. I have established a program for updating allotment plans and dealing with conflicts and conditions of overuse on an allotment-by-allotment basis over the next three years. On winter ranges where availability of forage is critical to big game, I am reserving fall green-up for the exclusive use of big game. Prohibition of domestic stock grazing on lower Squaw Creek and Island RNA is designed to maintain benchmark areas that have experienced little or no grazing in the past. Lower Squaw Creek represents one of the best examples of excellent riparian conditions on the Forest and Grassland. In my judgement the decisions relating to the administration of the grazing program described in the Plans allow each situation to be considered on its merits at a project analysis level. This approach is an equitable one, in my opinion. Those permittees which have over the years practiced good range management will have their...

ROD - 24
efforts rewarded. Where there have been abuses, actions will be taken to correct the situation (see Riparian Area Management discussion which follows).

RIPARIAN AREA MANAGEMENT

DECISIONS

1. See also Decisions and Rationale under Livestock Grazing (pp. ROD 23-25), and Anadromous Fish (p. ROD-99).

3. Allocation of an average 200-foot streamside management unit (average 100 feet each side) for all perennial and intermittent streams (to which standards and guidelines for protection of riparian areas and water quality have been applied).

4. Application of even-aged or uneven-aged silviculture systems where appropriate

5. Establishment of watershed sensitivities and Forest-wide threshold guidelines of no more than 25-35% of the Forest vegetation removed (harvested) in a watershed at any one time as shown in Table 12.

6. Development of a program for structures, instream devices and woody debris for riparian area and channel condition improvement (see project schedules, Forest Plan, Appendix A).

8. On approximately 40 miles (1,000 acres) of selected streams, the streamside management area will average 200 feet on each side to provide "connective habitat."

RATIONALE

The Forest Service is required by law to meet the requirements of the Clean Water Act. In addition, fisheries and fish habitat are important Forest resources, particularly anadromous fish. With national focus on riparian area management and water quality, as well as increased recognition of the importance of anadromous fish habitat, the Forest Service can no longer tolerate nor allow uses or practices which favor individual interests at the expense of riparian areas and water quality. The decisions I've outlined above are a forward step in providing correction and improvement in conditions where necessary, and in assuring that the Forest Service meets its obligations in respect to requirements of law, regulations and objectives for riparian management established by this Plan.

TRANSPORTATION SYSTEM

DECISIONS

1. Road standards, design and densities (transportation planning) will be related to allocations and management area objectives in the Final Plan.

2. Average open road densities in General Forest (MA-F22) will be 3 mi./sq.mi.; for Winter Range (MA-F20) it will be 1 mi./sq.mi. on a seasonal basis. This decision relates to big game habitat needs.

3. The use of off-road vehicles (ORV’s) on the Forest and Grassland will be controlled in respect to management area objectives and resource protection needs as specified in the Forest and Grassland Plans (Standards and Guidelines, Chapters 4), and summarized in Tables 13 and 14.

* Management Area G12 is administered by the State.

RATIONALE

Decisions related to the transportation system are primarily based on the need to develop and maintain road systems which meet the particular management objectives for an area. Cost-effectiveness and safety are integral in the documents.

In order to minimize motorized use conflicts on the Forest and Grassland, I am adopting a set of restrictions based on existing authority and regulations, that limits or authorizes use of ORV's in a manner compatible with the management objectives of this Plan.

BIG GAME HABITAT

DECISIONS

1. Potential big game winter ranges have been identified on the National Forest and Grassland. To meet ODFW objectives 64,130 acres are allocated to big game winter range on the National Forest (MA-F20), 12,740 acres on the Grassland (Metolius Deer Winter Range MA-G2), and 22,700 acres of antelope winter range on the Grassland (MA-G1).

2. Available winter range on the Forest that is not needed to meet State of Oregon population goals for elk is 107,360 acres (MA-F21). Cover objectives for General Forest (MA-F22) will apply to MA-F21, but other factors such as road densities and vegetation manipulation practices may be altered on a project specific and opportunity basis to benefit big game.

3. No areas are specifically allocated for big game summer range, but big game habitat requirements, and protection of habitat features, will be incorporated into all project analysis on a case-by-case basis.

4. Management areas with seasonal road access restrictions specifically to provide big game habitat and security are, but may not be limited to:

Grassland:

Antelope Winter Range (MA-G1), Metolius Deer Winter Range (MA-G2) - Control access as needed to enhance big game winter range and support other resource objectives.

General Forage (MA-G3) - Close roads seasonally in specific areas: deer hunting season, Sept. 20 - Oct. 30.
Juniper Old Growth (MA-G5) - Control access to protect old growth habitat

Rimrock Springs Wildlife Area (MA-G10) - Allow only administrative and permittee traffic.

National Forest:

Eagle Roosting (MA-F12) - Except for constant service through routes, use will be restricted to administrative use and use by permit only during Dec. 1 to May 1.

Hammer Creek Wildlife/Recreation (MA-F18), Winter Range (MA-F20), General Forest Winter Range (MA-F21) - Except for constant service through routes, use will be restricted during the periods of Dec. 1 to May 1. Access routes will be limited to one mile per section during that period, and three miles per section on the average the remainder of the year.

Old Growth (MA-F6) - Constant service roads will remain open. Use on all other roads across the management areas will be eliminated.

5 Establishes Hammer Creek MA-F18 (2,560 Acres) in the Maury Mts which feature big game and wildlife habitat management.

6 Establishes habitat effectiveness indices guidelines for MA's -F18, 20, 21 & 22 (see Table 15)

7 Open road densities on the National Forest in General Forest (MA-F22) will not exceed, on the average, three mi/sq.mi. on Winter Range (MA-F20) the open road density from Dec. 1 - May 1 will not exceed one mi/sq mi. on the average.

RATIONALE:

In the establishing requirements for big game habitat on the National Forest and Grassland, I have attempted to recognize the regional and local importance of this resource. The decisions incorporated into the Plans for big game habitat are significant, yet they have been accomplished with very little effect on other resource outputs. They will place additional restrictions on motorized use of some areas of the Grassland and Forest at certain times. With more people, better access, and motorized technology this is necessary to provide habitat security for big game, and to achieve population objectives established by ODFW.

ROADLESS AREAS AND WILDERNESS STUDY AREAS (WSA's)

DECISIONS

1 Designates nonwilderness, multiple use allocations for those roadless areas that were reviewed under 36 CFR 219 17 and not recommended for wilderness designation under the Oregon Wilderness Act of 1984. (See Tables 16-18.)

TABLE 15

ROD - 29
Ochoco National Forest Plan
Corrected Page, October 6, 1989
2. Recommended no wilderness for Deschutes Canyon-Steelhead Falls, a study area designated by the Oregon Wilderness Act of 1984; instead allocates 7,840 acres, part which contains portions of the WSA designated for semiprimitive nonmotorized recreation (see also, Decision 4, this page) Other portions of the WSA are included in the Deschutes Scenic River as classified under the Oregon Rivers Act of 1988 Maintains options on the North Fork Crooked River Wilderness Study Area, on which the Bureau of Land Management is the lead agency preparing the environmental documentation and has recommended nonwilderness in a draft EA, until Congressionally decided

3. Establishes a Lookout Mountain Management Area (MA-F11 A&B) and management concept which incorporates the entire Lookout Mountain area, including existing access roads into Brush Creek and Independent Mine Designates 7750 acres (MA-F11A) for unroaded semiprimitive recreation, and the remainder of the area (MA-F11B) for recreational and wildlife habitat purposes. Vegetation management activities and access development would be done only if they can be demonstrated at the project planning level to benefit recreation and wildlife interests No entry for purpose of stand treatment is scheduled or programmed for this planning period unless site-specific analysis is completed and plans approved otherwise Any timber removed through vegetation manipulation projects would be on a nonscheduled or nonchargeable basis

4 Establishes an 7,840-acre Squaw Creek Management Area (MA-G8) on the National Grassland and provides specific decisions for access, recreation, and wildlife habitat management in the area (see Livestock Grazing and Allotment Management, p ROD-23). Identifies the eligibility and suitability of lower Squaw Creek for scenic river classification under the Wild and Scenic Rivers System and recommends designation as a Scenic River.

RATIONALE

1 Roadless Areas

The Green Mountain roadless area was proposed in the Draft Plan/EIS preferred alternative for motorized semiprimitive recreation. There was little, if any, support for that designation in the public comments. In addition, the suitability of the area for such use,
and the details for implementing that type of management, were not convincing based on information available. I have therefore allocated the area to other (multiple) uses as shown by Table 18, pg ROD-29

Silver Creek Roadless Area (MA-F10) is proposed to remain essentially as described in the Draft preferred with some minor adjustments to assure a more manageable boundary. There appeared to be general public support for the area as proposed in the Draft.

The Rock Creek and Cottonwood Creek roadless areas were proposed in the Draft to remain unroaded. Public comment and additional analyses supported the idea that portions of these areas might be entered for timber management purposes, and that idea has been incorporated into my final decision (Table 18). Approximately 11,820 acres of the 19,073-acre roadless area will remain unroaded (MA-F8), of which 2,480 acres will be available for helicopter logging (MA-F9), where it is in fact economical and able to be accomplished with no additional road building in MA-F8 or the adjacent old growth areas identified. My decision to retain 11,820 acres in unroaded status is based on several factors. First, the area proposed to remain unroaded (MA-F8) is generally very steep, low in productivity, and has highly erodible soils. Both streams have anadromous fish spawning potential. There is little assurance, with current economics and technology, that these steep slopes could be logged while still protecting water quality. In addition, the difficulty of access afforded by the unroaded area will provide habitat security for big game.

What the outcome will be for the Lookout Mountain roadless area has been perhaps the most controversial issue for the Forest. Prior, and to an extent concurrent to this planning effort, Congress reviewed the Lookout Mountain Area for incorporation into the National Wilderness System. Senate report #98-465 states *This area is presently managed as a 'Special Management Area' for dispersed recreation and backcountry values. The area is not presently in the timber base. The Committee expects the Forest Service to examine the feasibility of continuing this use in the current National Forest Plan and determine the land allocation in the Forest Plan.* This has been done and the decisions described above, and by the Alternative I map. It is further described by the rationale below.

I do not intend to reopen the 4-wheel drive road from the Independent Mine to the summit of Lookout Mountain. This road was closed and rehabilitation work conducted in 1982. The location and grade make this 4-wheel trail unsuitable and unsafe for general public use, with the potential to result in unacceptable resource damage. The construction of improved road access to the summit would be in conflict with management objectives for the area. Snowmobile use on Lookout Mountain will be allowed to continue. At this time, I have not been convinced that the amount of snowmobile and cross country ski use in the area results in any irreconcilable conflicts (see Winter Sports, pg ROD-37). Some separation between snowmobile and ski trails, as planned, should relieve the present concerns. Because the existing roads to Independent Mine and Brush Creek are a part of the management of the Lookout Mountain area, the decisions made regarding these roads affects the Lookout Mountain area. I have chosen to incorporate these access routes into the management area. I have identified a mountain top subunit (MA-F11A) that is a mosaic of mountain meadow, steep drainage heads, shallow, rocky soil, and low productivity forest. This part of the mountain, I have determined is best left unroaded for semiprimitive recreational opportunities and wildlife habitat. On the lower elevation subunit (MA-F11B), which is for the most part productive forest land, I am proposing that recreation and wildlife habitat also be emphasized. However, in my judgement, those resources, and the forest setting for related activities, might be enhanced or maintained over time by appropriate vegetation management and access development.

My decision is that before any activities are initiated in MA-F11B, site specific planning and additional public involvement be completed. Project level analysis will be started within the first half (3-5 years) of the planning period to follow. To be consistent with our intentions, I have not scheduled the removal of timber products from this area, and it is not part of the Forest ASQ. I also intend to pursue opportunities to tie research into this management proposal.

2 Wilderness Study Areas

a Deschutes Canyon - Steelhead Falls

The 10,000-acre Deschutes Canyon-Steelhead Falls Wilderness Study Area (WSA) was Congressionally designated in the Oregon Wilderness Act of 1984. Within the WSA, powerlines, private lands, range allotments and improvements, roads, a pumping station and old homestead sites occur. In the Draft Plan/EIS a 5,200-acre area was recommended for wilderness. This area centered on the Deschutes River and Squaw Creek canyons. It had a minimum of the above nonconforming features.

While public comment received generally supported the wilderness designation of this area, serious...
question also surfaced on the manageability of the area as wilderness. Questions were raised in respect to the confinements of Squaw Creek canyon's ability to withstand concentrated recreational use and still retain the natural features that occur there. Access for range management activities and power line maintenance, access to private land inholdings for power line maintenance, and the limited size of the proposed area were other nagging questions. Meetings were held with a few of the key individuals interested in the area, and contacts with other agency representatives were made in an attempt to seek solutions to the apparent potential problems with wilderness designation and management for this area.

In this process the Forest Service attempted to identify what were perceived as the important resources within the area in order to determine if wilderness designation was the best course of action, or if there were better means to protect those resources. The resources identified were

- Natural springs, e.g. Alder Springs
- Geologic formations
- Solitude in the Canyons
- Metolious deer winter range
- Squaw Creek fisheries
- Squaw Creek riparian area

My conclusion was, the tentative proposal in the Draft Plan/EIS for wilderness did not provide a manageable situation, and in fact would work to the detriment of protection and management of the above resources.

In place of wilderness in the Final, I have identified a 7,840-acre management area (MA-G8) centered on Squaw Creek, the management of which would emphasize the above resources and semiprimitive nonmotorized recreation. Existing road access is planned to be restricted on a seasonal basis and some roads will be permanently closed (see Travel Plan). In order to make a logical management area, and to encompass the resources identified in public consultation, the boundary of MA-G8 takes in portions of Squaw Creek canyon not included in the original inventoried roadless area or WSA. In addition, I have made an eligibility and suitability determination for Squaw Creek and am recommending the lower portion, approximately seven miles, of Squaw Creek for an addition to the Wild and Scenic Rivers System.

The Deschutes River Canyon part of the WSA, involving approximately 650 acres of National Grassland, was classified as a Scenic River under the Oregon Rivers Act of 1988.

The direction and objectives for the management of the Squaw Creek unit (MA-G8) are given in Chapter 4 of the Grassland Plan. In my judgement implementation of the wilderness proposal in the Draft Plan/EIS had not been thoroughly analyzed and would have resulted in an unmanageable situation because of size of area and nature of the terrain, that was not in the best interest of the resources involved. The management direction for MA-G8, combined with the river classification for the Deschutes River canyon and Squaw Creek, are decisions which best protect the resources identified, retain options, and is in alignment with interests of all user groups concerned. I am therefore recommending no wilderness designation for the Deschutes Canyon-Steelhead Falls WSA. No actions will be taken that conflict with existing options until Congress either accepts or rejects this recommendation.

b North Fork Crooked River

The North Fork Crooked River WSA is described in the BLM "Wilderness Environmental Impact Statement for Oregon" (draft 1985, pp 265-275, and Supplement to the DEIS, pp. 373-379). There are National Forest lands, 1,125 acres, involved in the 10,745-acre WSA. The BLM's preferred alternative is "no wilderness" for this area. The Forest Service will retain the wilderness option on its 1,125 acres until the wilderness study is complete. If the final decision is no wilderness, the land allocations for the National Forest system would be as shown in Table 18, pg ROD-29.

**SCENIC OR VISUAL RESOURCES**

**DECISIONS**

1. The canyon slopes viewable from Lake Billy Chinook Reservoir on the National Grassland have been identified as a scenic resource (MA-G13).

2. A visual corridor averaging 1,200 feet (average 600 feet each side) in width along 260 miles of Forest road has been allocated. Of this, 23,960 acres are "partial retention" and 9,300 acres are "retention" (MA-F26).

3. A separate site-specific plan for the management of the Highway 26 corridor has been developed and appended to the Forest Plan (MA-F25).

4. A visual corridor averaging 1,200 feet (average 600 feet each side) in width has been allocated in conjunction with the Round Mtn National Recreation Trail (MA-F27).
5. Segments of the Summit Historic Trail have been allocated on the basis of visual management objectives (partial retention, retention and preservation, MA-F7)

6. Foreground viewing areas around developed recreation sites have been assigned visual management objectives (MA-F13)

7. Certain scenic or concentrated recreational use areas have been allocated for recreational purposes, and protection of the recreation setting, features, or attractions prescribed (MA-F16, 17, 19).

8. All Forest management areas (allocations) have been assigned a visual management objective (see Plans, Chapters 4, Standards and Guidelines)

RATIONALE

The predominant character of the Ochoco Forest is open ponderosa pine interspersed with parklike openings. On north slopes dense stands of mixed conifers occur. The Grassland setting is one of semidesert shrub, grassland and canyon environments. The large pine and dense forest which give the Ochoco its characteristic setting are also commercially valuable.

It is my intent to maintain the Forest setting and visual character of the Ochoco National Forest to the extent practical over time. The visual settings where people recreate and visit are important to the impressions and experiences they gain. Primary roads and Highway 26 are areas of the National Forest with the greatest amount of public use. The intent in these places is to identify particularly sensitive and visually important areas where forest management will be modified to meet visual management objectives. Where feasible, uneven-aged management, and selective removal of trees or groups of trees, will be practiced to enhance viewing. Assignment of Forest-wide visual objectives by management area emphasizes my commitment to forest management in a manner that protects and retains visual character and diversity over time on the Ochoco National Forest.

OLD GROWTH FOREST

DECISIONS

1. The Forest has allocated 72 stands containing 21,970 acres of old growth (MA-F6) to be managed on a "dedicated basis" for its ecological and habitat values. Of this amount, 20,700 acres are determined to be "suitable" and 1,270 acres "capable.

2. The distribution, forest types, and acreage of individual stands are listed in Table 19 (see also Management Area map).

3. In addition to the above allocations, habitat for old growth dependent species may, in some cases, be provided by management areas which are planned for extended rotations or no scheduled treatment. Includes: MA-F1,2,3,4,5,7,8,9,10,11, 12,15,16,17,18,19,23,24,25,26,27.

4. Based on our best data at this time the decisions in the Forest Plan appear to affect the quantity of available old growth over time as is indicated in Table 20.

5. Seven hundred forty acres in areas dispersed across the National Grassland have been identified and will be dedicated as "old growth juniper habitat," to remain in an undisturbed condition.

6 One thousand acres of "connective habitat" have been identified within the Riparian zones (see Decisions, Riparian Area Management, p. ROD-25) which is designed to provide travel ways for old growth dependent species between suitable habitat areas.

RATIONALE

I have elected to dedicate 21,970 acres of old growth stands on the National Forest and 740 acres of juniper on the Grassland (22,710 acres) for the purpose of preservation over the course of this planning period. To the extent feasible these areas have been located in a manner to minimize conflicts with other resource objectives, and to meet the habitat requirements identified for indicator species (see old growth management area map in the FEIS).

7/ In Dry Creek RNA
8/ In Stinger Creek RNA

NOTE: These acres do not coincide with those shown for Management Area acres in Chapter 4 of the Forest Plan, which is 18,570 ac for MA #6 Old Growth. 18,570 does not include 300 acres of old growth in the NF Crooked River Wilderness Study Area or old growth assigned to each of the wildernesses and RNA’s shown above which adds up to 2,400 acres (2,400 + 18,570 = 21,970)
This figure does not include the old growth which, in addition, occurs in wildernesses and unroaded areas. As shown by Table 20, the total amount of old growth in the first decade for the Forest is estimated to be 93,800 acres. An estimated 55,100 acres of the total will still remain by the fifth decade. In my judgement this should adequately provide for the wildlife habitat needs of dependent species. It also preserves representative old growth forest types for their own purpose.

I have not elected to provide old growth by extending rotations in selected stands because of the uncertainties and irreplaceable nature of old growth forest. Management direction in some of the allocations (e.g., MA-F15,16,17,18,23,24) calls for extended rotations and time will show, if in fact, such places provide effective habitat for old growth dependent species.

For the National Grassland, I have decided to identify some areas of juniper to remain undisturbed. The distribution and size of these areas are based on habitat requirements of the common flicker. Juniper habitat is not a rarity in Central Oregon, but because of the extensive use of prescribed fire, clearing, and firewood cutting on the Grassland, it would appear prudent to identify some juniper stands to remain undisturbed over time. Grazing would continue in these areas, but the existing juniper woodlands identified would be preserved.

I have considered the question of "island biology" or "isolation of populations" raised by allocating widely dispersed areas of old growth. To address

1/ Dedicated old growth is the sum of old growth blocks on the Forest identified to meet the management requirement for the piliated woodpecker (based on one 300 acre block per 12,000 acres).

2/ Those dedicated old growth acres that fall within wilderness and/or wilderness study areas.

3/ Old Growth Management Areas: F8 and G5 (includes capable acres).

4/ Wilderness, Wilderness Study Areas: F1, F2, F3, F4.

6/ Total Existing Old Growth from 1987-1998 inventory. This does not include the 1,270 capable acres allocated for old growth for distributional purposes. The total existing old growth for decades 2 through 5 represents that remaining after implementation of the Forest Plan and programmed timber harvest. The figures are estimates using the planning process data base and FORPLAN modeling.

ROD - 36
the question, if in fact time proves it to be relevant, I have introduced the concept of "connective habitat" into the Plan through riparian corridors and extensive blocks of existing old growth in unroaded areas and wilderness.

FUELWOOD SUPPLY

DECISIONS

Standards and guidelines for fuelwood availability are included in the Forest and Grassland Plans.

RATIONALE

It is my decision, that in order to prevent loss of wildlife habitat, only down trees, or standing dead juniper and lodgepole pine will be cut. Standing, signed wildlife trees or snags along road sides or within old sale areas will not be cut. To avoid conflicts with other uses on the Forest or Grassland, we will continue to designate areas open to firewood gathering and require permits as may be necessary. Firewood cutting will not be allowed in dedicated old growth areas, as it would defeat the purpose for which these areas are established. The Forest and Grassland will continue to meet a share of the fuelwood supply for the local communities, but within requirements necessary to meet other resource objectives as outlined above.

SNAG DEPENDENT WILDLIFE

DECISIONS

1. The Forest will be managed to provide snag habitat at levels appropriate to the resource objectives for the management areas involved (see Table 21)

2. Snag habitat may be provided either through identifiable patches or evenly distributed snags (see Standards and Guidelines, Chapters 4, Plans).

3. The overall Forest snag level of 47 percent is planned to increase over time as shown below:

<table>
<thead>
<tr>
<th>Decade</th>
<th>Level (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>47%</td>
</tr>
<tr>
<td>2</td>

</table>

Under my decision for snag levels, the number of snags on the Forest are projected to increase over time. Snags will be increased in ponderosa pine forest that presently has less than desirable levels; in mixed conifer areas with currently high levels, the number of snags will decrease. In no case are snag objectives for areas, other than where public safety is a concern, set below 40 percent. In my judgement, the varied objectives from 40-100 percent as shown by management area will assure adequate snag habitat occurring across the Forest at any one time.

WINTER SPORTS

1. The Ochoco Divide accessed by Highway 26 will continue to be emphasized for opportunities for winter sports recreation. A 1,580-acre area (MA-F16) at Bandit Springs (north of Highway 26) will be managed exclusively for cross-country
skiing, and nonmotorized snow play activities. The area to the south of the highway will be open for snowmobile use. The sled hill use south of Highway 26 at the juncture of FS Road 2630 (Crystal Springs Road) will continue as an established use area.

2. The Bandit Springs winter sports area (MA-F16) will have a visual quality objective of retention.

3. Lookout Mountain (MA-F11) will remain open to motorized over-the-snow use. Established snowmobile routes and play areas in the Lookout Mountain saddle through to the Round Mountain/Walton Lake area (MA-F22) will continue.

4. Backcountry skiing will be available in the Round Mtn (MA-F22) and Lookout Mtn areas (MA-F11). Trails may be designated on Lookout Mtn to separate, at places, snowmobile and cross-country skiing use.

5. Restrictions such as over-the-snow motorized use on designated routes only and area closures, may be imposed in big game winter range and eagle roosting areas (MA-F12, 20, 21). Essentially, the remaining general forest (MA-F22) will be open to snowmobile use unless otherwise designated.

RATIONALE

Winter sports activities are established uses on the Forest. In my judgement, the above decisions allow the continuation of these activities, and minimize the potential for conflict between motorized and nonmotorized winter sport activities. The decisions also support and provide a basis for the continuing enhancement of winter sports activities on the Forest and minimize potential conflicts with big game utilization of winter habitat.

OTHER MULTIPLE USE DECISIONS

Recreation

Recognizes established dispersed recreation sites on the Grassland and National Forest, and provides direction and objectives for their management (Plans, Chapters 4, Standards and Guidelines; see also Alternative I map).

Maintains and continues the management of developed recreation facilities, including 10 fee campgrounds, 13 non-fee campgrounds, 7 dispersed sites with facilities, 4 developed picnic areas, and 4 boat ramps; provides schedules for development of additional recreation facilities (Plans, Chapters 4, Standards and Guidelines).

Provides schedules for recreation trail and trailhead development, including those for winter sports.

Makes the decision that the cooperative agreement for the management of the Cove Palisades State Park, which is due for renewal in 1990, be amended to include language in regard to a Forest Service and State partnership for the management of the area.

A 74-mile Summit Historic Trail, involving a 1,200-foot corridor with visual management objectives assigned by trail segments, is designated. This trail is also intended to serve as part or all of the East-West Interstate trail across the Ochoco N.F.

For Round Mountain, I have considered the need for a "special management area" for recreation as proposed by Oregon Natural Resource Council (ONRC). At this time I do not see that the uses occurring there demand such an allocation. The mountain top electronic site, road(s), skiing and snowmobiling, and national recreation trail (see Winter Sports, pg ROD-37) all take place as part of the multiple uses in General Forest (MA-F22) and are addressed in the standards and guidelines, as well as other multiple use coordination decisions within the Plan. However, I will take the need for a recreation management area on Round Mtn. under advisement and propose to consider it through further planning (see also "Changes....General Recreation," pg ROD-44).

Research Natural Areas

Identifies and recommends establishment of five new research natural areas (RNA's), and continuation of the one RNA already established on the Forest (see Table 22, p ROD-39)
TABLE 22

* National Forest or National Grassland

Anadromous Fish

Approximately two percent of the National Forest and Grassland are identified for riparian area management (see Riparian, pg ROD-25). Streamside management areas are increased in width to 400 feet on some anadromous fish streams to provide additional protection for riparian areas, and to serve as "connective habitat." Anadromous fish streams are identified as "sensitive" and equivalent harvest areas (EHA's) were established that reflect their sensitivity in the conduct of cumulative effects analyses (see also p. ROD 54)

I will make it a point that the Columbia River Intertribal Fish Commission (CRITFC) be contacted early in the scoping phase of analysis for any projects located in anadromous fish drainages on the Forest or Grassland. In addition, when the Inter-regional agreements with the Forest Service and CRITFC, which are presently being studied are finalized, this Plan will be amended within such time as is practical to incorporate those policies.

Eagle Roosting Areas

Six eagle roosting areas, 570 acres, have been allocated. An additional two roosting areas fall within old growth units. These areas were identified through contract study and are part of an eagle recovery plan under the Federal Endangered Species Act.

Wild and Scenic Rivers

Determines that 7.5 miles of lower Squaw Creek on the National Grassland, 1,370 acres, is eligible and suitable for possible inclusion in the National Wild and Scenic River System as a scenic river. Incorporates rivers legislatively designated in the 1988 Oregon River Act, and sets the stage for further planning required under the Wild and Scenic Rivers Act.

Grassland
Crooked River - Recreational
Deschutes - Scenic

Forest
North Fork Crooked River (two segments)
Recreational
Scenic

ORV Use

Off-road vehicle use has been addressed under transportation system (pg ROD-26). Only trails historically established for ORV use are being designated at this time. Any others will be accomplished in the plan implementation phase through site-specific analysis and further planning. Restriction guidelines by management areas have been outlined in the Travel Plan and Appendix D, and are summarized herein.

COMPATIBILITY WITH OTHER AGENCY GOALS AND PLANS

The goals of other agencies, which could be affected by National Forest system management, were considered early in the planning process and used to develop alternatives in the DEIS and FEIS. Public agencies expressed their view during the comment period on how well the Draft Plan met their objectives. (See FEIS, Appendix I for a list of the public agencies comments on the DEIS and Proposed Plan; and Appendix A for a list of agency's contacted early in the planning process.)

Alternative I has been carefully coordinated with goals and objectives of the State of Oregon and other agencies, particularly the Bureau of Land Management and Indian Tribes. The Plan integrates the recreation and visual resource opportunities and needs identified by the State and meets the wildlife habitat management objectives and places emphasis on economic stability in respect to timber yield and industry associated jobs and income.
IV. Changes From Draft Preferred and Rationale

PLAN STRUCTURES AND ALLOCATIONS

Draft

The Plan for the National Forest and National Grassland was one document.

The National Grassland had eight management areas in the Draft, and the National Forest had 14

Final

Two separate Plans were developed, one each for the National Grassland and the National Forest, covered by one Environmental Impact Statement.

In the Final, the Grassland has 16 management areas, the Forest 28

Summary of Changes

Separate plans for National Grassland and the National Forest; treated under one DEIS.

Refinement in management area allocations.

Changes in resource emphasis.

Reasons For Change

National Grassland management and direction was overshadowed by the National Forest. The public requested they be separated into two plans.

Additions and changes in management areas (allocations) resulted from responses to public comments, incorporation of new information, new policies, improved understanding of processes related to implementation, and congressionally designated rivers.

Rotation age for ponderosa pine=130 years, mixed conifer=90 years, sustained yield, even-flow (by cu ft vol.), declining volume in ponderosa pine after first decade.

Decade Cu Ft. Bd Ft
1 19 0 115 0 82 0
2 19 0 - - -
3 19 0 - - -
4 19 0 - - -
5 19 0 - - -

ASQ

Forplan Modeling

The changes from "draft" to "final" have resulted in differences in FORPLAN modeling. The changes in allocations and related management guidelines have resulted in the development of new yield streams for timber and other resources, silvicultural systems, rotation ages, and decade harvest limitations

Summary of Changes

incorporation of uneven-aged management in ponderosa pine where stand structure, condition, and management objectives allow.

Larger tree at rotation for general forest ponderosa pine 18"-20" vs 14"-16" (wood quality).

Sustained even-flow in cu.ft.vol vs. departure (on total volume basis).

Maintains relatively high volume of ponderosa pine first decade, but less than in the Draft Plan

Uneven-aged timber management applied to ponderosa pine on general forest (20-inch target size).

Uneven-aged timber management applied to ponderosa pine in special areas with 30-inch DBH target size: Lookout Mountain, Stein's Pillar, Deep Creek, North Fork Crooked River

Uneven-aged timber management (group selection) applied to mixed conifer in some areas

Extended rotation ages and new thinning cycles for ponderosa pine in general forest.

Extended rotation and stricter decade harvest limitations for certain areas.

Changes in the percent thermal cover required by allocation.

More reliance on mixed conifer to produce thermal cover vs. ponderosa pine.

b Acres and Timber Yield Tables

Acres - Condition classes (i.e. the amount of pine sawlogs, saplings, etc.) have been updated from the 1983 information used in the Draft. This was done to more accurately assess timber harvest scheduling and resultant associated outputs and effects

Timber Yield Tables - Yield tables were updated to reflect the growth that has occurred in the last five years in order to more accurately determine outputs and effects.

Rod - 41
Large target diameters (27"-30+") for recreation, wildlife and visual emphasis management areas

FORPLAN model yield tables, acres, prescriptions and assumptions changed to reflect updated information (see above)

Reasons For Change

Response to public comment for uneven-aged management, growing larger trees, maintaining historic harvest levels in ponderosa pine, sustained yield even-flow vs. departure, improved and updated information and scheduling over time.

ECONOMIC ANALYSIS

Changes in schedules, outputs, allocations, effects, assumptions and new information results in different economic effects and outputs in the Final

Incorporation of additional resources into the economic analysis overlooked in the Draft (mineral leases, anadromous fisheries)

WILD AND SCENIC RIVERS

Forest Draft

Segments of North Fork Crooked River, Crooked River, and Deschutes River eligibility studies completed and management units developed to preserve options for river classification.

Summary of Changes

Rivers Designated by Congress

Lower Squaw Creek evaluated and determined eligible for Wild River designation

Reasons for Change

Oregon Wild and Scenic Rivers legislation Lower Squaw Creek evaluation conducted based on public comment and legislative hearings related to above Act

WILDERNESS STUDY AREAS

Forest Draft

Proposed recommending 5,200 acres (2,500 FS, 2,700 BLM) in the Deschutes Canyon-Steelhead Falls Wilderness Study Area for wilderness classification.

Forest Final

No additional wilderness proposed.

A 7,840-acre Squaw Creek management area emphasizing semiprimitive, nonmotorized recreation, protection of natural features, and vehicle access management incorporates core of previously recommended wilderness; the majority of the remainder of the draft proposed wilderness was included in the Deschutes Scenic River Corridor classified by the Oregon Wild Rivers Act in 1988.

A 7.5 mile segment of Squaw Creek has been determined to be eligible and suitable for inclusion in the Wild and Scenic River System as a scenic river.

Summary of Changes

From 5,200 acres recommended for wilderness which was centered on Squaw Creek and the Deschutes River Canyon, to a 7,840-acre management unit centered on Squaw Creek; classification of the Deschutes River and canyon portion under the Wild and Scenic Rivers Act, recommendation that a 7.5 mile segment of Squaw Creek be designated as a scenic river.

Reasons For Change

Because of small size and topography which would concentrate use, the manageability and classification under the Wilderness Act was questioned. The Deschutes River canyon portion was classified and protected under Wild and Scenic Rivers Act.
The public expressed interest for classification of Lower Squaw Creek under Wild and Scenic Rivers Act

ROADLESS AREAS

See Tables 16-18, pg ROD-29

Summary of Changes

Green Mountain proposal for semiprimitive motorized recreation (the area remaining roadless) was dropped for reasons of no apparent public interest or support. Soil erodibility and slopes found not to be suitable for that use.

Rock Creek/Cottonwood Creek area to be managed as unroaded was decreased. A portion of the area which was determined to be economical for timber management was allocated to general forest and unroaded helicopter. Steeper areas were reserved for roadless area management, or helicopter logging, to protect watershed, anadromous fish, recreation, and wildlife values.

Silver Creek area to remain roadless was adjusted to a more manageable boundary along canyon rim.

Lookout Mountain area to remain unroaded was increased from 2,950 acres to 15,660 acres. The entire roadless area, plus road corridor, is treated as a separate management unit. Planning for stand treatments for recreation and wildlife will begin in first decade, and no entry will be scheduled until project planning is completed and approved.

A portion of the Deschutes River Canyon-Steelhead Falls Wilderness Study Area, and an additional area outside the WSA in Squaw Creek, are combined to form a 7,840-acre management area emphasizing semiprimitive, nonmotorized recreational opportunities and wildlife habitat management. The 5,200-acre draft wilderness proposal is dropped.

Reasons For Change

Response to public comments. Effort to address the resource values involved in a more specific manner. Implementation concerns.

LOOKOUT MOUNTAIN

Draft

2,950 acres to be managed for semiprimitive nonmotorized recreation, 11,323 acres allocated to general forest and scheduled timber harvest, the remainder to old growth areas. The top of the mountain is closed to snowmobiling.

Final

A 15,660-acre Lookout Mtn. area treated as one management area within which there is a 7,550-acre mountain top unit, and two old growth areas. The 8,110 acres remaining are to be managed in a manner that emphasizes recreational and wildlife habitat values and maintains the character of the Forest over time. Additional site-specific project planning is required. Road access corridors (Brush Creek and independent mine roads) are incorporated into the management unit. No scheduled timber harvest. The entire area is open to snowmobiles during specified periods.

Summary of Changes

Treatment of entire Lookout Mountain and access corridors as a management area.

No entry planned in the first decade prior to completion of site-specific planning.

An increase in unroaded mountain top management area from 2,950 to 7,550 acres.

The lower part of the mountain also managed with recreation and wildlife emphasis.

No scheduled or chargeable timber harvest.

Open to snowmobiling during specified periods.

Reasons For Change

Public comment. Address resource values involved in a more specific/responsive manner.

2/ Discussed separately. See Wilderness, pg ROD-42 for Deschutes Canyon-Steelhead Falls Wilderness Study Area (WSA) and this page for Lookout Mountain.
VISUAL or SCENIC RESOURCES - Trails, Roads, Recreational Developments

Tables 23 and 24 detail the extent of change in visual resource management allocations between the Draft and Alternative I. Table 23 shows the changes in visual resource allocations between the Draft and Alternative I and Table 24 the acres of visual quality objective by allocation for Alternative I.

1/ Includes 170 acres which were allocated to Preservation

### Summary of Changes

Immediate/foreground viewing area around recreational developments (campgrounds) allocated and assigned a visual management objective.

The acres with visual management objectives increased from 46,449 in the Draft to 64,300 in the Final. The width of the viewing corridor used in calculations was changed from >2640' to 1200'.

Entire Summit Historic Trail corridor was assigned a visual management objective relative to cultural aspects of the particular trail segment.

Round Mountain National Recreation Trail management corridor reduced in width from >2640' to 1200'.

Added 560 acres of viewing area from Lake Billy Chinook reservoir on the National Grassland.

No middle ground viewing areas allocated as management areas.

All Forest management areas assigned a visual quality objective.

(See other management areas which have visual management objectives)

### Reasons For Change

To incorporate visual management considerations in important foreground viewing areas in a more balanced manner. New information. State of Oregon oral communication. Emphasis on maintaining character of the Forest.

### GENERAL RECREATION

#### Draft

No allocation of dispersed recreation site management. Discussed in general.

Bandit Springs winter recreation sports area identified.

Restricted all motorized use from Lookout Mountain summit.

No recognition of special features or recreational attractions (other than roadless areas, developed recreation, and wildernesses).

General discussion of significant historic trails. Interpretation of Summit Trail for public enjoyment; management of Round Mountain Trail discussed.
Recreational attractions and developments on the National Grassland generally discussed. Expansion at Haystack Reservoir noted

Final

New horse camps designated

Allocation of 665 sites (@3.1 acres/site) across the Forest and Grassland for dispersed recreation - based on Coda-A-Site and other inventories on file with specific management direction.

Bandit Springs recreation management unit (1,580 acres) allocated; deals with all-season recreational activities instead of only winter

Lookout Mountain open to snowmobile use in winter

Allocation of additional areas emphasizing recreational features or attractions and dispersed recreational opportunities, Stern's Pillar (1,070 acres), Hammer Creek (2,560 acres), Deep Creek (770 acres), Lookout Mtn. (15,860 acres), and recognition of Round Mtn for possible further planning.

Identifies and allocates the Summit Trail National Historic Route, with three different levels of management intensity per various segments. (See Visual/Scenic Resources, p. ROD-44)

Management areas identified (allocations) for Haystack Reservoir, Rimrock Springs Wildlife Viewing area, and Cove Palisades State Park.

(For additional information relating to recreation see Wilderness, Wild and Scenic Rivers, Roadless Areas, Travel Plan, Summit Trail, Visual, and Lookout Mtn. which are addressed separately herein.)

Summary of Changes

Increased recognition of importance of dispersed recreational activities and sites on the Forest and Grassland.

Incorporation of existing recreational attractions, developments, cultural resources and special features overlooked or for which information wasn't available in the Draft.

Lookout Mtn. continuing to remain open to snowmobiles.

Reasons For Change

Improved and more complete information and public comment. National emphasis - recreation strategy.

WILDLIFE

OLD GROWTH

Draft

26,400 acres allocated; approximately 58% "suitable," 42% "capable" on National Forest only.

Final

21,970 acres old growth allocated; approximately 94% "suitable," 6% "capable."

1,000 acres of riparian area is recognized as connective habitat between some old growth areas. The connective habitat is allocated in Riparian MA-F15.

740 acres of old growth juniper allocated on the Grassland Recognition of MA's with extended rotation contribution to old growth habitat, as well as other allocations such as wildernesses and unroaded areas.

WINTER RANGE

Draft

76,000 acres of big game winter range to meet Oregon Department of Fish and Wildlife management objectives.

Final

99,570 acres of big game winter range (deer & elk) allocated, but redistributed spatially across the Forest and Grassland.

Identified 107,360 acres big game winter range that was not necessary to meet ODFW big game management objectives and therefore, not allocated as winter range, but recognized as a separate
management situation called ‘general forest/winter range.’

Added 22,700 acres to area identified as antelope winter range on the Grassland.

SUMMER RANGE

Draft

154,100 acres were allocated to big game summer range with specified amounts and quality of thermal cover for optimum big game habitat.

Final

No areas specifically allocated for big game summer range. Big game habitat requirements are considered throughout the general forest area.

Recognition that (thinning) bug-proofing of ponderosa pine stands, if done, would reduce big game habitat effectiveness due to the inability of those stands to provide cover.

Adjustments in cover guidelines to better reflect natural vegetation capabilities.

SNAGS

Draft

Specific snag management levels were set by management area, which averaged out to an overall forest average of 55% of the potential population level for snag dependent species.

Final

Specific snag management levels by management area average 47% of the potential population level in the first decade, and reach 54% by the fifth decade.

EAGLE ROOSTS

Draft

Management direction provided to preserve the integrity of actual and potential bald eagle winter roost sites, but none were specifically identified.

Final

Eight bald eagle winter roosts are identified. (Two are not shown on map because they are included within old growth areas which have more restrictive management prescriptions.) Site specific management plans for each eagle roost area will be developed in fiscal year 1989 and 1990.

HAMMER CREEK

Draft

No special management designated in Hammer Creek except for an old growth area.

Final

A 2,560-acre management area is allocated for wildlife and recreation emphasis. It surrounds an old growth stand and includes a variety of habitat types.

ROAD DENSITY

Draft

Open road density averaged four miles per section in timber/range emphasis areas, and two miles per section in big game emphasis areas.

Final

Open road density averages three miles per section in General Forest and one mile per section seasonally in winter range.

MODELING ASSUMPTIONS FOR HABITAT EFFECTIVENESS

Draft

Assumed potential four elk/square mile in ponderosa pine types; 10/sq mile in mixed conifer; average six/sq mile.

Final

Assumed potential six elk/sq mile in ponderosa pine types; 15/sq mile in mixed conifer; average nine/sq mile.
Summary of Changes

Reduction of total area allocated to old growth, but increase in quality ("suitable" vs. "capable") of that dedicated. Application of concept of "connective habitat." Increased recognition of importance of old growth occurring within other management areas (e.g. MA-F1, 2, 3, 7, 8, 10, 11, 12, 17, 18, 23, 24).

Allocation of old growth juniper on the National Grassland.

Improved spatial distribution of winter range allocations.

Additional acres of antelope winter range area identified and allocated on the Grassland.

Allocation of general forest/winter range in addition to winter range, resulting in improved maintenance of habitat effectiveness across the Forest.

Elimination of big game summer range allocation and consideration of some big game habitat requirements across general forest.

Snag management level increased on certain wildlife and recreation management areas created since the Draft, but with a minor overall drop in potential population level due to big game summer range allocation change.

Specificial identification and management direction for bald eagle winter roosts as part of a recovery plan under the Endangered Species Act.

Allocation of a Hammer Creek Management Area with an emphasis on wildlife habitat management.

Modeling assumptions for habitat effectiveness changed based on new information from ODFW.

More realistic cover requirements relating to forest types involved.

Emphasis on maintaining habitat with quality and quantity of cover and road density comprising the basis for rating habitat effectiveness.

Reasons for Change

Public comments. Consultation with State Department of Fish and Wildlife. Improved information and intent to improve implementability.

GRAZING MANAGEMENT

Draft

Forage utilization standards were broken out by slope class and meadows for each management area. They generally were the same, except for those in the Riparian Management Area which were more restrictive.

Allocation improvements were considered in respect to water developments required across Forest to improve utilization and distribution.

Final

Forage utilization standards developed by the Region for eastside Forests are used. There is one set of standards for riparian areas and another set for all other management areas not excluded from grazing. The standards are based on vegetation type, range condition and Forest and Range Environmental Study (FRES) strategies.

A system for prioritizing range allotment planning needs, and a program estimate for riparian improvements is established on an allotment-by-allotment basis for the Forest and Grassland.

Reasons for Change

Public comments. Provides a means to more effectively address the allotment-specific nature of concerns relating to grazing management, and to tier allotment management planning to the Forest and Grassland Plans.

TRAVEL/TRANSPORTATION PLANNING

Draft

All areas on the Forest/Grassland open unless otherwise designated, as determined by other management objectives. The ORV opportunities and closures were outlined on DEIS p.156 and a Travel Plan map published.

Allocated area to semiprimitive motorized recreation.
See road densities under wildlife, pg ROD-46.

Final

Travel access routes and areas designated with respect to management unit objectives. Travel plan map published in FEIS Refers specific designation of ORV trails to project level implementation, identifies closure order requirements

No areas allocated for exclusive ORV use

Summary of Changes

More specificity on area closure and designating of routes or roads within management areas

Refers ORV/OHV trail designation to project level implementation,

Additional emphasis on ORV management and control

Increased emphasis on improved road management with resultant reduction in open road density.

Reasons for Change

Public comment Coordination and attainment of other Forest management objectives, e.g., improvement of elk habitat effectiveness, reduction of visual and on-site impacts, and other management area objectives

RIPARIAN

Draft

Two allocations or prescriptions "Acceptable" and "Excellent." The latter was assigned to all anadromous fish streams and other to high value fish streams. Streams identified for improvement to either "Acceptable" or "Excellent" are listed in Forest Plan Appendix A12 and A15

Final

All streams will be managed under one prescription - "Excellent."

Analysis and scheduling of need for treatment is based on a recently updated (1987) stream condition inventory. This inventory aids in setting priorities when range allotment plans are to be updated. Riparian corridors on approximately 40 miles (1,000 acres) of high value streams have been expanded to offer additional protection to these streams and to enhance "connective* wildlife habitat. (See also Grazing Management, p ROD-47)

Summary of Changes

Provides a simplified and more direct approach - riparian area management planning and analysis priorities will be tied to stream condition and resource values

Allotment management planning will have more detailed direction and objectives.

Provides a system for prioritizing range allotment planning needs on the Forest

Introduces the concept and value of connective habitat.

Reasons for Change

Clarity in communicating planning details. Responsive to public, agency and internal comment. Provides specific information on objectives and impacts affecting allotment management and planning

UTILITY CORRIDORS

Draft

Utility corridors are addressed in general terms in the Forest-wide Standards and Guidelines

Final

Existing utility corridors (rights-of-way) are designated as a management area, 460 acres, in the Grassland Plan. Incorporates Federal Power guidelines and requirements (Western Regional Corridor Study, 1986)

3/ Prioritization is a guide, riparian improvement projects will also take advantage of funding or timing opportunities outside this schedule if they occur

ROD - 48
LAND ADJUSTMENTS

Draft

The land adjustment plan shows four categories of land:

"Consolidate ownership of Cove Palisades State Park area" is listed as a land adjustment priority.

Final

A fifth category is added: areas where Congress has directed the Forest Service to acquire non-Federal lands for a designated purpose. The Deschutes Scenic River and the North Fork Crooked River Scenic Corridor fall into this category.

The land adjustment maps are more detailed and based on recent analysis. Lands are placed in adjustment categories according to management area and priority.

The issue of ownership patterns for Cove Palisades State Park is deferred and opportunities for recreation management "partnerships" explored.

NATIONAL FOREST OWNERSHIP

Draft

National Forest ownership totaled 955,100 acres: 843,721 acres of National Forest, and 111,379 acres of National Grassland.

Final

National Forest ownership totals 956,150 acres: 844,640 acres of National Forest, and 111,510 acres of National Grassland, due to land exchanges which have occurred since the Draft was prepared.

MINERALS AND ENERGY

Draft

Oil and gas leasing activity planning was based on the Mineral Leasing Act of 1920 and the Mineral Leasing Act for Acquired Lands of 1947.

Table IV-6, "Average Annual Outputs by Decade," does not include outputs for minerals activities.

The economic analysis does not include revenues from oil and gas leasing.

The issue of providing a mining mineral inventory was deferred for resolution outside the Forest Plan.

Approximately 80% of the Forest and Grassland were leased for oil and gas.

No leasing would be allowed on administrative sites.

Leases would be issued with some restrictive stipulations in old growth areas.

Approval for mining operations will be given when concerns are mitigated in a responsible and responsive manner.

Final

The Federal Onshore Oil and Gas Leasing Reform Act of 1987 changes the way oil and gas leasing will be administered. Regulations governing leasing procedures are expected to be finalized in late 1989.

The economic analysis has been revised to include oil and gas leasing revenues, and mineral production figures have been updated.

A mineral potential map and mineral inventory were prepared.

Forest and Grassland area available for leasing is similar, but only approximately 10% of the Forest and Grassland are under lease, due to changes in oil prices.

Leases will be issued with a "no surface occupancy" stipulation on administrative sites.

Leases will be issued with a "no surface occupancy" stipulation in old growth areas.

Under the mining laws, claimants are entitled to access and develop their mining claims. Operating plans will include reasonable and operationally feasible requirements for timely and effective coordination with other resources.
V. ALTERNATIVES

Alternatives Analyzed and Resultant Disposition in the Final

In the DEIS, including the supplement, 12 alternatives were analyzed and presented in detail. In addition, eight benchmark alternatives were developed and utilized in the analysis process. The benchmarks served as analysis reference points to define bounds for comparison purposes only. They were not developed with the intent of being implemented. In the FEIS, six alternatives are analyzed in detail, the above remainder are treated as "considered, but eliminated from further detailed study" (Table 25). The basis for elimination of the alternatives was lack of public interest or support and relevance to the NEPA process in final analyses and document preparation.

A comparison of the acreage allocations (emphasis) by resource and decade outputs related to issues are presented for the six FEIS alternatives, including Alternative I in Tables 26 and 27. A brief description of the final alternatives follows.

Summary Description of Final Alternatives

Alternative NC - NO CHANGE:
The "No Change" alternative has been developed as a no-action alternative representing current management plans. It provides for a level of goods and services as defined in unit plans and the 1979 Timber Resource Plan. The alternative does not comply with all provisions of the National Forest Management Act (NFMA), and could not be implemented or used in future management of the Forest without Congressional and/or Secretary of Agriculture action to change the law (see Supplement to the DEIS).

Alternative A - NO ACTION (CD BNCH in Table 25):

This is the "no action" alternative required by the National Environmental Policy Act. It would continue the present course of action established in plans and policies formulated and approved prior to passage of the NFMA and that have been made consistent with present laws and regulations. Relatively high levels of timber production, combined with visual quality objectives, and moderate levels of fish and wildlife, are emphasized in this alternative. In the Draft this alternative was represented by the "Current Direction Benchmark with NFMA."

Alternative B - Modified - FOREST PRODUCTS INDUSTRY PREFERRED

This is the alternative supported by the forest products industry. Alternative B - Modified evolved from Alternative B, and B-plus post-Draft discussions. Alternative B - Modified was developed by industry by amalgamating selected aspects of Alternative I with Draft B.

TABLE 25

</tr>
</tbody>
</table>

1/ Alternative B Modified represents evolution and change of Alternative B plus proposed by timber industry. Alternative B Modified is a new industry alternative It is different than B plus in the draft, the letter of which was much the same as Alternative B

2/ Preferred Alternative I

3/ Current Direction Benchmark with National Forest Management Act (NFMA) is now Alternative A in this FEIS
The intent is to provide a high level of timber output with some considerations for other resources.

Alternative C-Modified - ENVIRONMENTALLY PREFERRED ALTERNATIVE:

Alternative C-Modified emphasizes resources associated with amenity values. For example, riparian areas, scenic corridors, retention of roadless areas, recreation and forest management designed to provide big game habitat. Old growth and snags would also be provided at high levels. Timber and range resources would be managed at comparatively low levels. This is generally the alternative supported by the conservation community.

Alternative E-Departure - DRAFT PREFERRED:

Alternative E-Departure was the Draft preferred alternative. It emphasizes a combination of timber production, roadless recreation, and big game habitat. Timber is scheduled as a departure from nondeclining yield. In other respects, this alternative is the same as Draft Alt. E. Timber harvests are scheduled so that first decade volumes remain close to current levels, and then decline over the next 10 to 50 years. The departure is designed to maintain local economic conditions for the short term. All resources are managed or maintained at least at moderate levels.

Alternative I - FOREST SERVICE FINAL:

This alternative represents a new alternative evolved from E-Departure, the Draft Preferred Alternative, in response to new information, recent legislation, and public comment. It is the agency’s preferred final. This alternative seeks to maintain a reasonably high level of commodity outputs on a sustained, nondeclining flow. In a complimentary and equitable manner it has also attempted to provide wildlife habitat and recreation resources, as well as preserving the character or setting of the Forest and Grassland over time. Alternative I differs from the Draft preferred E-Departure as described on pp. ROD 40-49.

1/ Forage production potentials may not be achieved and are at the minimum, directly dependent upon the Implementation of the proposed improvements in the first decade. It is reasonable to expect that some or all allotments may experience up to a 10% reduction in AUM's during the first decade to allow the accomplishment of riparian management objectives.

2/ Total acreage for lands allocated to management areas with unroaded recreation emphasis (E3, F8, F10, F11, G8)

3/ Total acreage for lands allocated to management areas with visual resource emphasis (E5, D6, D7, G13, F25, F26, F27)

4/ Total acreage for lands allocated to management areas with old growth emphasis (D4, F8, G8)

5/ Total acreage for lands allocated to management areas with recreation emphasis (D6, G16, D11, F7, F8, F10, F11, F13, F14, F16, F17, F18, G8, G11, G12, G14)

6/ Acres on Round Mountain with recreation emphasis (applies to Round Mountain National Recreation Trail)
STATE OF OREGON ALTERNATIVE

This alternative was developed by the State of Oregon Governor's Federal Land Planning Team utilizing Forest Service data, and with a public review process separate from that conducted by the Forest Service. The alternative is a result of collaboration between the Forest Service, State agencies, the Governor's staff, and the public.

The analysis of the State's alternative has not been documented in a detailed comparison with other alternatives in the FEIS because of the late date it was received. However, the State of Oregon and Forest Service collaboration involved the former in the final decisions relating to the selection of a plan for the Forest and Grassland.

There were significant differences between the State's alternative and the DEIS preferred Alternative E-Departure. These differences were greatly reduced through the changes I have made between the Draft and Final (pp. ROD 40-49). I now find that the State's alternative is similar to the Forest Service Alternative I. We are together in respect to major and important issues, for example: the level of ASQ, roadless area allocations, disposition of the Deschutes Canyon-Steelhead Falls Wilderness Study Area, big game winter range allocations, grazing management, snag levels, allocations emphasizing recreation, management and planning for ORV use, and the decisions on snowmobile use on Lookout Mountain.

There was, however, some clarification between the State's recommendations and Alternative I needed which I will list here and then address, for the record, below.

STATE RECOMMENDATIONS:

1. Apply more stringent riparian management requirements on anadromous fish streams.
2. Further reduce road densities.
3. Limit numbers of dispersed sites and reduce their visual quality objective.
4. Reduce visual management requirements on certain Forest roads and apply uneven-aged management instead.
5. Add the pine marten and the northern three-toed woodpecker as indicator species.
6. Reach a sustained even-flow for ponderosa pine volume within a decade.
7. Provide a stable timber supply for Harney County.
8. Use both CF and BF measurements for planning and management.
9. Increase the amount of uneven-aged management.
10. Add RNA's.

FOREST SERVICE RATIONALE AND FINDINGS RELATING TO STATE RECOMMENDATIONS ABOVE:

1. Riparian Management

My proposal for riparian area management has had substantial changes between the Draft and Final. It is essentially in agreement with the State, and is in line with recommendations from CRITFC. The only point where we disagree appears to be the level of protection for streams within the John Day Basin. The State feels that the anadromous fish runs in this basin warrant extra protection. There is no disagreement on this point. The State further proposes no scheduled harvest from riparian areas along major perennial streams and no scheduled harvest along the lower half of the riparian areas on minor perennial streams. I believe the anadromous fishery in the Trout Creek watershed (Deschutes Basin) is equally as important and should be included in this discussion.

Table 28 indicates the amount of protection afforded by the Forest Service Alternative I which is, in addition to the standards and guidelines, applied to maintain the ecological potential of these fisheries.

At this time, I believe adoption of the State's proposal for the Ochoco National Forest for more stringent protection in the John Day Basin through non-scheduling of harvest for riparian areas would result in insignificant change to the conditions attainable for the Ochoco National Forest under the proposed Forest and Grassland Plans. Here is why. As shown by Table 28, the level of protection which is being provided for anadromous fisheries is substantial. Half of the stream miles with spawning are allocated to no timber harvest and another nine miles to a double-wide 400 foot corridor. This translates into over 70 percent of the riparian areas which support the spawning of anadromous fish having a special emphasis above that proposed for nonanadromous riparian areas. The remaining streams are protected by a 200 foot corridor, standards and guidelines, reduced timber harvest levels, and more stringent requirements relating to cumulative effects (see Table 12). Therefore, I believe that Alternative I will result in attaining the desired future condition for these streams. With intensive monitoring, any problems will be detected and changes can then be made.
2. Road Densities

The State is of the opinion that open road densities in winter range should not exceed one mile per section in the winter and 2.5 miles in summer, and that densities in general forest (MA-F22) and general forest winter range (MAF-21) should be 2.5 miles per section. The only difference between the State's proposal and mine is the recommendation of 2.5 miles per square mile compared to three miles per square mile. I find reducing the road density to 2.5 miles per square mile would have little to no effect on predicted elk numbers and a 0 to 5 percent change in habitat effectiveness. However, the change to the 2.5 mile guideline would significantly increase road management costs. Since we achieve State big game population objectives with the road densities in Alternative I, and the State and the Forest Service are in agreement that we both desire to manage roads effectively to meet wildlife and recreation objectives, I conclude our differences on this point are really insignificant. With monitoring and further studies (e.g., Starky Experiment Station), improved knowledge concerning open roads will allow future opportunity for any needed adjustments.

3. Dispersed Recreation Sites

Nine hundred and fifty dispersed recreation sites were identified by the Forest Service, and 1,970 acres (MA-F14) allocated for this use. The visual quality objective for these sites was decided to be retention. The State supports this approach, but they recommend a visual objective of partial retention. The change to partial retention in my opinion, would not significantly increase the ASQ on the Forest. Further, the State was concerned that the allocation be limited to the originally identified sites and that the implementation of the Plans not set the stage for a proliferation of new sites, thereby increasing the application of retention standards and hence a potential reduction in ASQ across the Forest. It is my intention that the Forest and Grassland Plans be initially implemented with the acreage allocated as in MA-F14 and MA-G14. Dispersed recreation sites may likely be identified or dropped in future project level planning. With appropriate project analysis and documentation, the dispersed recreation sites identified and their management will likely be modified over time.

4. Visual Management

Between the Draft and Final, my staff re-evaluated visual management objectives for road corridors and viewing areas surrounding recreation sites. The resultant changes, with which the State is in agreement, pertain to elimination of partial retention middleground as an allocation and the reduction in average corridor width to 1.200 feet. The reduction in road corridor to a more realistic width has allowed us to manage more miles of travel corridors with a visual objective and with less loss in timber volume than was possible under the draft preferred alternative approach.

However, we have two apparent differences which involve the specific corridors to be protected and the role of uneven-aged management in visual corridor management, especially on Highway 26. First, the State's proposal differs from that of the Forest Service in that they recommend no visual management objective for roads 12, 16, 42, 4155, 4370, 45, 58, and 5840, involving approximately 5,200 acres. Instead they propose using uneven-aged management wherever feasible and extensive slash clean-up. I believe that reducing the visual management objective to less than partial retention would result in unacceptable consequences to the visual character along important routes and would create inconsistency across the Forest in how visual quality travel objectives are being applied.

The other difference is a proposal for uneven-aged management as the primary method of management for Highway 26. It is my position that uneven-aged management is only one of the silvicultural systems available to meet visual quality objectives; others may also be appropriate to meet objectives dependent on conditions. My decision is that the silvicultural system which best meets objectives for a given situation will be applied.

The Highway 26 corridor is presently managed under an existing visual corridor management plan which will be revised to bring it into compliance with the Forest Plan. This includes incorporation and utilization of uneven-aged management along Highway 26 where it is appropriate.

5. Additional Indicator Species Suggested

A question regarding indicator species arose—concern was expressed about the preservation of pine marten habitat in old growth lodgepole pine on eastern Oregon forests. The Ochoco National Forest has approximately 10,000 acres of widely scattered lodgepole pine stands, most of which occur below the elevational limits for habitat for pine marten. In short, this particular Forest does not have the natural habitat to support a viable population of pine marten. The same situation exists for the northern three-toed woodpecker.
6. Ponderosa Pine Harvest Level Over Time

The State proposed that ponderosa pine volume be leveled within the first decade versus Alternative E-Departure I have chosen to do this over a two decade period, while attempting to minimize the drop and fluctuation and decline between decades two and five (Table 29).

Ponderosa pine volumes proposed for Alternative I are more stable over time than that of in the draft preferred (see Table 29). This is the result of changes from draft to final I have made involving return to sustained yield vs departure, the addition of uneven-aged management, changes in rotation diameters and extended rotations for some management areas, and the model constraints placed on maximum first decade pine volume. It should be noted that although pine volume is estimated to vary through time as showed by Table 29, combined species volume in Alternative I is on a sustained-yield basis.

It is my belief that given the structure of the local economy and the uncertainty of the future that this approach better serves local economy needs and is more realistic given the complexities of controlling species mix, sale scheduling, and changing market conditions. The gradual two decade decrease in ponderosa pine also allows more flexibility in working with neighboring National Forests in order to maintain a more stable timber supply for the Burns area.

7. Harney County Timber Supply

Concern was expressed over future timber supply in Harney County. Attention was brought to the importance of the Malheur and Ochoco National Forests coordination to insure a relatively stable timber supply. It was asked that I analyze ASQ levels to try to more evenly schedule the ponderosa pine volume over time; including decline in the first decade to a sustainable level. As with the ponderosa pine issue above, I have given considerable thought to this question. The same measures used to level Forest-wide pine volume apply to the Snow Mountain District pine volume scheduling. Additional constraints were modeled at the District level to help address this concern.

The State asked for 34 MMBF in the first decade from the Snow Mountain District with declining volume in decade two and beyond; and, that we, in conjunction with the Malheur National Forest, provide a stable flow of ponderosa pine from the Snow Mountain and Burns Ranger Districts in decades two through five. Table 30 shows that the projected volume from the Snow Mountain District is in agreement with the State’s proposal. Also, volume from decade two on can be manipulated with no effect on the first decade schedule. The Ochoco National Forest volume, combined with a preliminary estimate from the Malheur National Forest, shows only minor deviations from the State recommendation until the fifth decade (third decade for pine volume). I am, however, directing the Malheur and Ochoco National Forests to continue to coordinate and monitor this issue with the intent of assuring the stability of a timber supply, within the extent practicable, in the Harney County area.

8. Timber Volume Measurement

The State advocated use of both cubic foot and board foot targets for ASQ. This is simply not practical at this time. There is considerable variation from stand to stand within the FORPLAN model classes, and it would be difficult to plan sales by making the board foot/cubic foot ratio of each stand a major decision factor in the selection of areas for harvest.

The Regional and National direction (1920 ltr 9/13/88 and FS handbook 1922.15) is to use the actual cubic feet volume scheduled for harvest in the first decade to determine the board feet scheduled for harvest. Both CF and BF will be tracked in monitoring. The Forest Service expects to make the transition from the use of board feet to the use of cubic feet sometime within the first decade.

9. Uneven-aged Management

The State believes that the Forest should conduct uneven-aged management on more than 100,000 acres of ponderosa pine in the General Forest (MA-F22) in addition to riparian, visual areas, et al. Again, I am in agreement in principal, but stand conditions such as mistletoe and stand structure may limit the practicality of this. For now, the Plan will include management using uneven-aged management on 100,000 acres of ponderosa pine and ponderosa pine/mixed stands. As part of the implementation and monitoring, we will look for additional opportunities to use uneven-aged management and where it will meet management objectives and where stand conditions are conducive it can be applied.

1/ Includes volume potentially available from the Ochoco and Malheur National Forests in the Burns area (based on available information at this date - Malheur N F is subject to change based on outcome of their final plan)
10. Additional RNA's Suggested

The State pointed out they want to meet establishment of the natural areas identified in the Oregon Natural Heritage Plan. We therefore are in agreement on the five RNA's proposed in Alternative I. The State further recommended that the Forest should work with the Oregon Natural Heritage Advisory Council to investigate the possibility of incorporating two potential additions they have identified. I have directed the Forest to work with the PNW Experiment Station ecology section and with the Council to determine the significance of these and any other potential additions. The Forest will recommend their incorporation into the Plan by amendment if they should so warrant.

VI. REQUIRED COMPARISONS OF ALTERNATIVES

PRESENT NET VALUE (PNV) OF ALTERNATIVES

The preferred Final, Alternative I, has the highest PNV (Table 31). While Alternative I does not offer the greatest timber volumes of the alternatives considered, the amount of timber it provides does not exceed the point where discounted benefits equal or exceed discounted costs (marginal rate of return is positive), this, in addition to a high amount of nonmonetary benefits, provides for a relatively high level of economic efficiency. Alternative B-Modified, while providing higher levels of timber availability, is actually less economically efficient. In short, it exceeds the point where the discounted benefits are rising faster than the discounted costs. Another way of saying this is that the value of the extra timber in this alternative is lower and the costs to get it are higher. Alternative C-Modified fails to capture economic opportunities and relies heavily on nonmonetary benefits (see FEIS Appendix B).

ENVIRONMENTALLY PREFERABLE ALTERNATIVE AND NONSELECTION RATIONALE

The "environmentally preferable" alternative is defined by the Council of Environmental Quality (CEQ) regulations as the alternative causing the least adverse impact to the biological and physical environment. This is Alternative C-Modified which emphasizes aesthetic values, wildlife, wilderness, dispersed and unroaded recreation on the Forest. These are nonmonetary resources which generally do not have established market values. Economist's inability to express these values satisfactorily in monetary terms may be reflected in the PNV of this alternative, which is 395 million dollars (based on a 50-year period) as compared to Alternative B-Modified at 455 million dollars, which emphasizes commodity resources.

</tr>
<tr>
<td>NC</td>
<td>380</td>
</tr>
</tbody>
</table>

I did not select Alternative C-Modified or B-Modified. The former fails to fully recognize demands imposed by local communities, and the economic realities of our society. Another way of expressing this is that Alternative C-Modified does not provide a balance between environmental considerations and economic realities; there are benefits associated with Alternative C-Modified, but implementation could be done only with very high costs and radical change to established local, social and economic settings (see Table 27). The corollary to this is Alternative B-Modified, which while possibly providing the greatest economic benefits in the short term, has potentially undesirable environmental and socio-economic effects over time. It reduces options and increases risk for environmental impacts and socio-economic change that could be irreversible.

I believe Alternative I reflects recognition for the landscape and resource diversity of the Forest and Grassland through the allocations or management areas identified. While the output of commodity resources from Alternative I is considerably greater than the "environmentally preferable" Alternative C-Modified, the specificity and detail in allocations, and subsequent mitigation through application of standards and guidelines (see Mitigation, p ROD-62) assures a high level of environmental protection and retention of future options.

In my judgement, Alternative I provides appropriate environmental safeguards at a minimum direct economic cost. This alternative incorporates the perspective that the Forest Service is the trustee of
the environment for succeeding generations. An objective of Alternative I is to provide for the proper and continued development of resources in a manner that maintains economic stability, yet retains local natural heritages, such as wildlife habitat, outdoor recreation opportunities, water quality, scenic qualities and open range.

VII - IMPLEMENTATION SCHEDULES

SCHEDULES AND IMPLEMENTATION

The Forest Plan will be implemented through identification, selection, and scheduling of projects to meet the management goals and objectives provided by the Plan (see Plan Appendix A).

The schedule of proposed and possible projects for the first decade is contained in the appendices of the Forest and Grassland Plans. Project schedules will be available for review at the Ranger District Offices and Supervisor’s Office. Schedules of possible projects will routinely change as projects are implemented or are removed from the listings for other reasons, and as new projects take their place. Adjustments to the schedule may be made based on results of monitoring, budgets, and unforeseen events.

The Forest Plan provides direction in the form of goals and objectives, standards and guidelines, monitoring requirements, and probable scheduling of management practices. It does not cover projects on specific sites except in a broad manner. Each proposed project will be subject to site-specific analysis and documentation in compliance with NEPA. Considerations revealed through this process may result in a decision not to proceed with the proposed project, even though the project may be permissible under the Forest Plan.

The Plan’s scheduled projects are translated into multiyear program budget proposals. The schedule is used for requesting and allocating the funds needed to carry out the planned management direction. The Forest’s current year tentative annual program of work will be derived from this process. Upon approval of a final budget for the Forest, the annual work program will be updated and carried out.

The Forest work program will implement the management direction of the Forest Plan. Outputs and activities in individual years may be significantly different from those shown in Chapter 4 of the Forest Plan, depending on final budgets, new information derived from updated inventories and monitoring, and any future amendments or revisions of the Forest Plan.

The Forest Plan supersedes or incorporates all previous land and resource management plans prepared for the Ochoco National Forest and Crooked River National Grassland as described by Table 1, p. ROD-4. Upon implementation of the Plans, management activities will be made to comply with them. Appropriations or budgets may alter the schedule of activities. In addition, all permits, contracts, and other instruments for the use and occupancy of National Forest System Lands and resource uses must be in conformance with the Forest Plan. Such documents will be revised where needed as soon as practicable, subject to valid existing rights. This updating will generally be done within three years.

All timber sales offered for sale after issuance of the Forest Plan will be in compliance with direction contained in the Plan. Timber sales now under contract will be administered under provisions of the existing contracts. Changes to existing timber sale contracts may be proposed on a case-by-case basis where overriding resource considerations are present. (See also, Consistency, p. ROD-3)

AMENDMENT AND REVISION PROCESS

This Forest Plan may be changed either by an amendment or a revision. Such changes may come about as a result of the monitoring process or project analysis (Figure 1, p. ROD-61). An amendment may become necessary as a result of different situations. They can include, for example:

- Recommendations of the Interdisciplinary Team based on their review of monitoring results.

- The determination that an existing or proposed permit, contract, cooperative agreement, or other instrument authorizing occupancy and use is not consistent with the Forest Plan, but should be approved, based on project level analysis.

- Adjustment of management area boundaries or prescriptions.

- Changes necessitated by resolution of administrative appeals.
Based on an analysis of the objectives, guidelines, and other aspects of the Forest Plan, the Forest Supervisor shall determine whether a proposed amendment would result in a significant change to the Plan. If the change is determined to be significant, the Forest Supervisor shall follow the same procedure as that required for development and approval of a plan. If the change is determined not to be significant, the Forest Supervisor may implement the amendment after appropriate public notice and compliance with the NEPA (Figure 1). The procedure is described by 36 CFR 219.10(e) and (f), 36 CFR 219.12(k), FSM 1922.51-52 and FSH 1909.12.

The Regional Forester will approve significant amendments, and the Forest Supervisor "non-significant" amendments. The determination of significance must be documented in a decision notice and would be appealable under 36 CFR 217. A mailing list will be maintained to provide notification and invitation to comment on proposed amendments.

The amendment documentation will include at a minimum:

- A statement of why we are amending the Forest Plan (some possible reasons are mentioned above)
- The actual amendment showing exactly how it will look
- Rationale for the amendment
- A statement of significance related to FSM 1922 51 (This is the NFMA significance and relates to changes to the Forest Plan)
- A statement regarding NEPA compliance (40 CFR 1500-1509, FSM 1950, and FSH 1909 15) regarding effects on the environment and how the effects disclosed in the Plan EIS may change as a result of the amendment
- A statement of the appeal rights.

With respect to revision, the NFMA requires revision of the Forest Plan at least every 15 years. However, it may be revised sooner if physical conditions or demands on the land and resources have changed sufficiently to affect overall goals or uses for the entire Forest. If a revision becomes necessary, the procedures described in 36 CFR 219.12 will be followed. The Chief, however, must approve the scheduling of such revision.

VIII. MONITORING AND MITIGATION

MONITORING AND EVALUATION

The Monitoring and Evaluation Program is the management control system for the Forest and Grassland Plans. It will be used to provide information on the progress and results of implementation. One of the results of monitoring will be an assessment of the need for amending or revising the Plan. The monitoring and evaluation are discussed in more detail in Chapters 5 of the Plans.

Monitoring is intended to help keep the Forest Plan dynamic and responsive to changes. Monitoring and evaluation each have a distinctly different purpose and scope. Monitoring consists of gathering data, observations, and information. During evaluation, the data and information are analyzed and interpreted. This process provides the information necessary to determine if conditions are within the bounds and intent of the Plan direction. Forest Plan monitoring does not replace or substitute other Forest monitoring activities. Many activities are currently being monitored on the National Grassland and Forest to comply with administrative and legal responsibilities (FSM - 1410 Admin Review Procedures).

Monitoring and evaluation will provide information to determine if

- Management prescriptions are producing the predicted or desired environmental effects
- Laws, regulations, and policies are being followed, including Regional Guide and Plan Standards and Guidelines
- The Forest and Grassland Plan is responsive to the issues, concerns, and opportunities
FIGURE 1

      - Implement
  - Significant (NFMA)
    - RF has authority
    - Prepare Plan Amendment (steps 1-10 NFMA)
      - Prepare decision (NEPA) document
        - Implement

ROD-61
- Costs of implementing the Plan are as projected.
- Predicted outputs are being produced.
- There are new issues and concerns not adequately addressed by the Plan.

Results of the evaluation will lead to decisions of the following types.

- Continue practice, no change necessary.
- Refer the problem to the appropriate Forest officer for corrective action
- Modify the management practice through Plan amendments
- Modify land allocations through Plan amendments.
- Revise output schedules.
- Revise unit output costs.
- Revise the Plan

**MITIGATION**

Mitigation measures are intended to minimize or eliminate potential conflicts or adverse effects of implementation. Mitigation measures have been developed through interdisciplinary efforts and incorporated into the Plans at different levels in several different ways.

- The standards and guidelines and management area prescriptions in Chapter 4 of the Plan are a fundamental and integral part of these measures, and as such they are a basic and essential part of the Plan.

- The allocations (Tables 5 and 6, pp ROD 16-17) play an important role in mitigation by the separation of incompatible uses, impacts, and conflicts.

- National Forest Management Act (NFMA) requirements were incorporated into the planning process and are reflected in the allocations and standards and guidelines (EIS Appendix B, and SEIS, Pt II)

- Mitigation measures are developed at the site-specific project level of planning, and projects are “tiered” to other planning level measures above (see p. ROD-1).

**IX. APPEAL RIGHTS**

This decision may be appealed in accordance with the provisions of 36 CFR 217 by filing a written notice of appeal within 90 days after the publish date of the Notice of Availability in the Federal Register on September 15, 1989. The appeal must be filed with:

F. Dale Robertson, Chief
USDA Forest Service
P. O. Box 96090
Washington, D.C. 20090-6090
Reviewing Officer

A copy must simultaneously be sent to:

James F. Torrence, Regional Forester
Pacific Northwest Region
USDA Forest Service
319 S W. Pine
P. O. Box 3623
Portland, OR 97208-3623
Reviewing Officer

The notice of appeal must include sufficient narrative evidence and argument to show why this decision should be changed or reversed (36 CFR 217). Requests to stay approval of the Forest Plan under 36 CFR 217 will not be granted.

Decisions on site-specific projects are not made in this document. The schedule of proposed and possible projects for the first decade is contained in the appendices of the Forest Plan. Final decisions on these proposed projects will be made after site-specific analysis and documentation in compliance with NEPA.

If you would like more information on the Forest Plan or environmental statement, contact the Forest Supervisor in Prineville. I encourage anyone who is concerned about the Plan(s), or decisions herein, to check first with the Forest Supervisor in Prineville, Oregon, (503)447-6247, before submitting an appeal, to see if concerns or misunderstandings might be resolved.
